Conventions in the manual

1. Text format conventions

Format	Explanation
< >	The content in < > is a button name. For example, click <Apply> button.
[]	The content in [] is a window name or a menu name. For example, click [File] menu item.
{ }	The content in { } is a portfolio. For example, {IP address, MAC address} means IP address and MAC address is a portfolio and they can be configured and displayed together.
→	Multi-level menus are separated by “→”. For example, Start → All Programs → Accessories. Click [Start] menu, click the sub menu [All programs], then click the submenu [Accessories].
/	Select one option from two or more options that are separated by “/”. For example “Addition/Deduction” means addition or deduction.
~	It means a range. For example, “1~255” means the range from 1 to 255.

2. CLI conventions

Format	Description
Bold	Commands and keywords, for example, show version , appear in bold font.
<i>Italic</i>	Parameters for which you supply values are in <i>italic</i> font. For example, in the show vlan <i>vlan id</i> command, you need to supply the actual value of <i>vlan id</i> .

3. Symbol conventions

Symbol	Explanation
 Caution	The matters need attention during the operation and configuration, and they are supplement to the operation description.
 Note	Necessary explanations to the operation description.
 Warning	The matters call for special attention. Incorrect operation might cause data loss or damage to devices.

Product Documents

The documents of SICOM3000TSN industrial Ethernet switch include:

Name of Document	Content Introduction
SICOM3000TSN Series Industrial Ethernet Switches Hardware Installation Manual_V1.0.pdf	Describes the hardware structure, hardware specifications, mounting and dismounting methods.
SICOM3000TSN Industrial Ethernet Switch Web Operation Manual	Describes the switch software functions, Web configuration methods, and steps of all functions.

Document Obtainment

Product documents can be obtained by:

- CD shipped with the device
- Kyland website: www.kyland.com

1 Product Introduction

1.1 Overview

SICOM3000TSN includes a series of high-performance industrial Ethernet switches developed by Kyland particularly for Smart Coal, Petroleum and Petrochemical, Power Industry, Factory Automation, Intelligent Transportation, Rail Transit and other Industries. The series devices meet the requirements of EN50155, EN50121 and other industrial standards. The switches support MSTP/RSTP/STP, DT-Ring, and IEC62439-6 redundancy protocols, providing multiple guarantees for the reliable operation of the system.

1.2 Software Features

SICOM3000TSN provides abundant software features, satisfying customers' various requirements.

- Redundancy protocols: DRP, STP/RSTP, VRRP and MSTP.
- Multicast protocols: IGMP Snooping, GMRP, PIM-SM, PIM-DM.
- Switching attributes: VLAN, PVLAN, GVRP, QoS, and ARP.
- Bandwidth management: port static aggregation, LACP, port rate limiting, and port storm suppression.
- Security: user management, access management, SSH, SSL, TACACS+, RADIUS, IEEE802.1X, ACL, IP Source Guard and Port Isolate.
- Synchronization protocols: SNTP, NTP.
- Device management: software update, configuration file upload/download, and log record and upload.
- Device diagnosis: port mirror, LLDP.
- Alarm function: power alarm, port alarm, ring alarm, and IP/MAC address conflict alarm.
- Network management: management by CLI, Telnet, Web and Kyvision network management software, DHCP, and SNMP v1/v2c/v3 network monitoring.
- Network related: NAT, DNS.
-

2 Switch Access

You can access the switch by:

- Console port
- Telnet/SSH
- Web browser
- Kyvision management software

Kyvision network management software is designed by Kyland. For details, refer to its user manual.

2.1 View Types

When logging into the Command Line Interface (CLI) by the console port or Telnet, you can enter different views or switch between views by using the following commands.

Table 1 View Types

View Prompt	View Type	View Function	Command for View Switching
SWITCH #	Privileged mode	View recently used commands. View software version. View response information for ping operation. Upload/Download configuration file. Restore Default configuration. Reboot switch. Save current configuration. Display current configuration. Update software.	Input “ configure terminal ” to switch from privileged mode to configuration mode. Input “ exit ” to return to the general mode.
SWITCH (config) #	Configuration mode	Configure all switch functions.	Input “ exit ” or “ end ” to return to the Privileged mode.

When the switch is configured through the CLI, "?" can be used to get command help. In the help information, there are different parameter description formats. For example, <1, 255>

means a number range; <xx:xx:xx:xx:xx:xx> means a MAC address; <word31> means the string range is 1~31. In addition, ↑ and ↓ can be used to scroll through recently used commands.

2.2 Switch Access by Console Port

You can access a switch by its console port and the hyper terminal of Windows OS or other software that supports serial port connection, such as HTT3.3. The following example shows how to use Hyper Terminal to access switch by console port.

1. Connect the 9-pin serial port of a PC to the console port of the switch with the M12-A-4P-M console cable.
2. Run the Hyper Terminal in Windows desktop. Click [Start] → [All Programs] → [Accessories] → [Communications] → [Hyper Terminal], as shown in Figure 1.

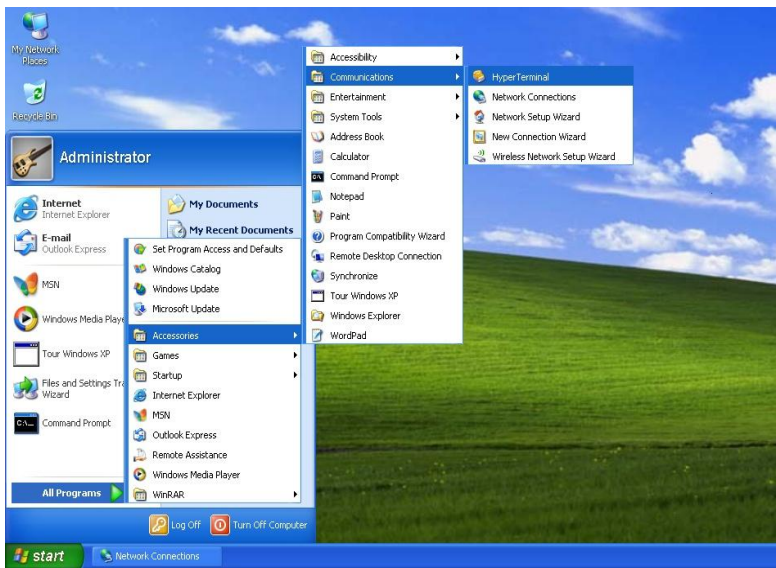

Figure 1 Starting the Hyper Terminal

3. Create a new connection "Switch", as shown in Figure 2.

Figure 2 Creating a New Connection

4. Connect the communication port in use, as shown in Figure 3.

Figure 3 Selecting the Communication Port

Note:

To confirm the communication port in use, right-click [My Computer] and click [Property] → [Hardware] → [Device Manager] → [Port].

5. Set port parameters (Bits per second: 115200, Data bits: 8, Parity: None, Stop bits: 1, and Flow control: None), as shown in Figure 4.

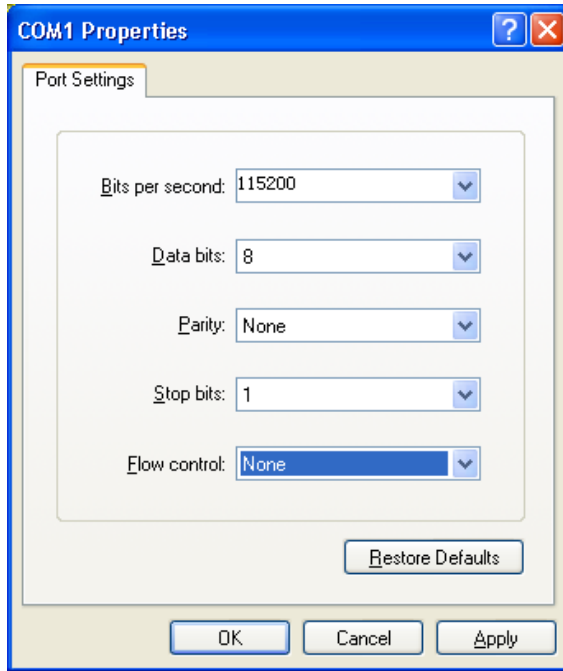

Figure 4 Setting Port Parameters

6. Click <OK> button to enter the switch CLI. Input default user "admin", and password"123" to enter the privileged mode. You can also input other created users and password, as shown in Figure 5.

Figure 5 CLI

2.3 Switch Access by Telnet

The precondition for accessing a switch by Telnet is the normal communication between the PC and the switch.

1. Enter "**telnet IP address**" in the Run dialog box, as shown in Figure 6. The default IP address of a Kyland switch is 192.168.0.2.

Figure 6 Telnet Access

**Note:**

To confirm the switch IP address, please refer to "7.3 IP Configuration" to learn how to obtain IP address.

2. In the Telnet interface, input user "admin", and password "123" to log in to the switch. You can also input other created users and password, as shown in Figure 7.

Figure 7 Telnet Interface

2.4 Switch Access by Web

The precondition for accessing a switch by Web is the normal communication between the PC and the switch.

**Note:**

IE8.0 or a later version is recommended for the best Web display results.

1. Input "IP address" in the browser address bar. The login interface is displayed, as shown in Figure 8. Input the default user name "admin", password "123", and the Verification. Click <Login>. You can also input other created users and password.

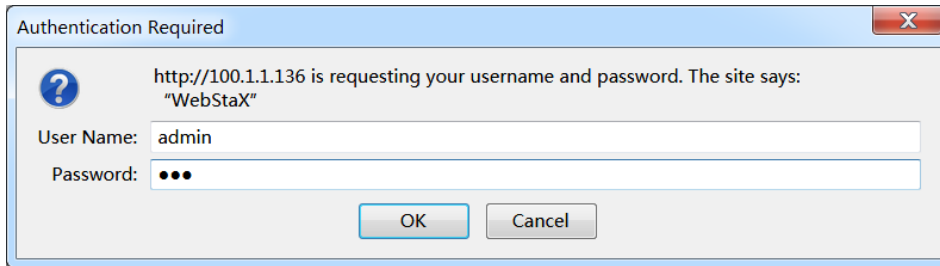

Figure 8 Web Login

Enter the main interface. In the upper right corner, you can switch to the English or Chinese Web operation interface. The English login interface is displayed by default.

Note:

To confirm the switch IP address, please refer to “7.3 IP Configuration” to learn how to obtain IP address.

2. After you log in successfully, there is a navigation tree on the left of the interface, as shown in Figure 9.

批注 [1]: 替图

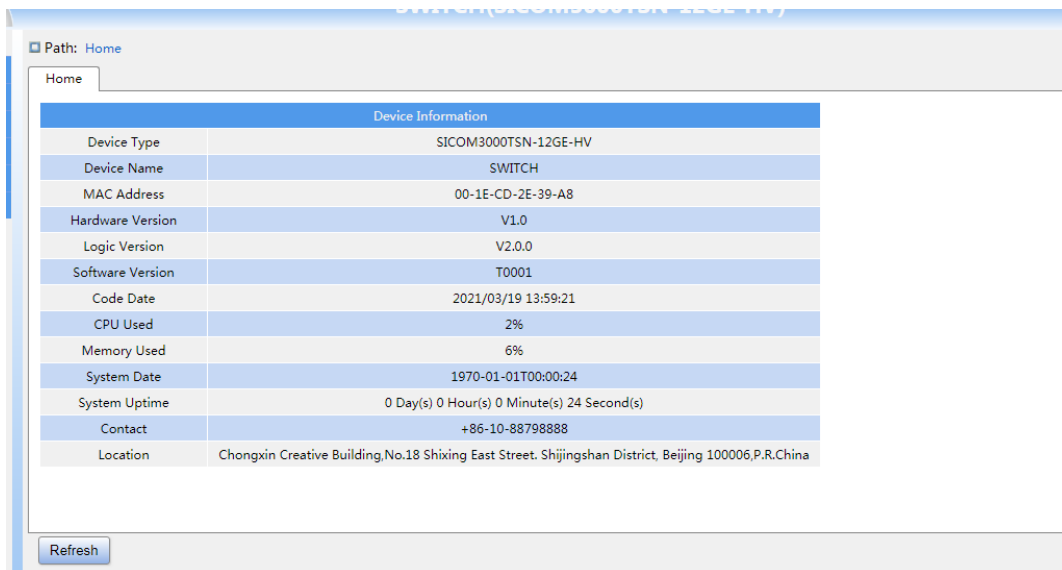

Figure 9 Web Interface

You can expand or collapse the navigation tree by clicking menu on the navigation tree. You can click [Home](#) to link to Figure 9, and click  to exit the Web interface.

3 User

3.1 User management

3.1.1 Introduce

To solve the security problem caused by illegal user access switch, the switch provides the function of user hierarchical management, based on different user identity, set different permissions to meet the diversify of user permissions control.

3.1.2 Web Configuration

1. Create a new user, as shown below.

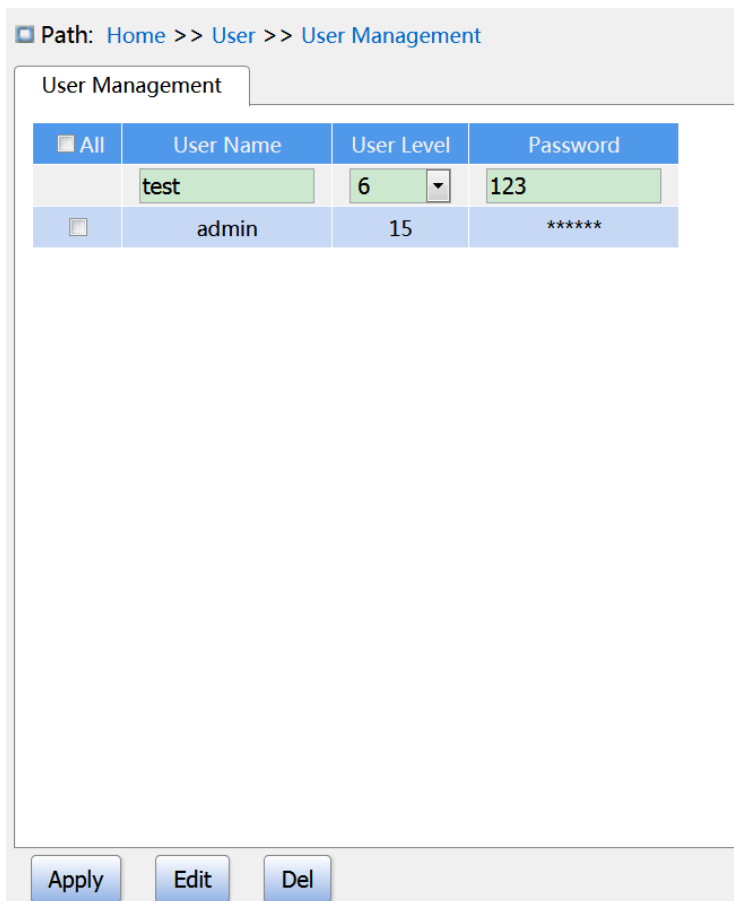

Figure 10 Create a new user

Add a new user in the user name formula bar, configure different user levels, and max 20 users can be created.

User name

Configuration range: 1~31 characters

Function: configure user name.

User level

Configuration range: 0~15

Function: Configure the user's permission level. Users with different permission levels have different access permissions.

Password

Configuration range: 0~31 characters

Function: configure user login password.

2. Edit user configuration, as shown below.

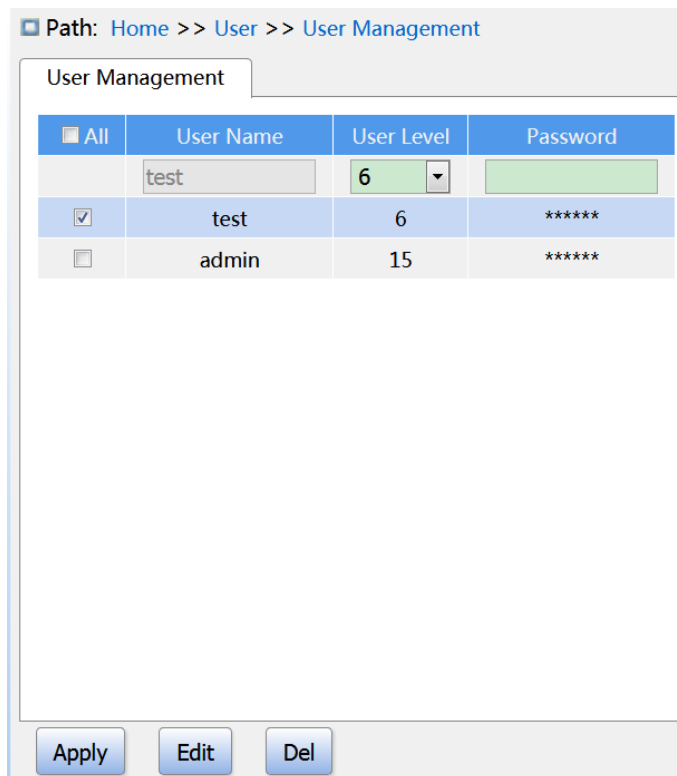

Figure 11 Edit user configuration

Check the user who needs to be edited, click <Edit> button to modify the password and permission levels of user.

Click button to delete the current user.

Note:

➤ The default user admin can't be deleted:

3. Configure groups privilege level, as shown below.

Path: Home >> User >> Access Configuration

Access Configuration

Group Name	Read Level	Config Level
*	0	0
System Information	10	10
Config Management	10	10
Set Time	5	10
NTP	5	10
SNTP	5	10
Firmware	15	15
Language Update	10	10
Reboot	10	10
HTTPS	5	10
SNMP	5	10
SSH	5	10
TACACS+	5	10
RADIUS	5	10
DNS	5	10
RMON Configuration	5	10
RMON Status	5	0
Alarm	5	10
Port Configuration	5	10

Apply

Figure 12 Configure groups privilege level

Group Name

Configuration options: All functional groups

Function: Select the switch function group for the operation

Read Level

Configuration options: 0-15

Default configuration: 5

Function: Configure the level at which the current function group can be viewed by the user.

Different levels of function groups have different permission level requirements for user viewing.

Config Level

Configuration options: 0-15

Default configuration: 10

Function: Configure the level at which the current function group can be operated by the user.

Different levels of function groups have different permission level requirements for user operations.

**Note:**

When the user privilege level is same or greater than a group privilege level, the user can access or configure the group. The access or configure right is based on the user privilege level.

3.2 Auth Type

Configure access mode to switch, authentication mode and authentication order, as shown below.

Auth Type			
Service Type	Authentication 1	Authentication 2	Authentication 3
Web	Local	--	--
Console	RADIUS	Local	--
Telnet	TACACS+	RADIUS	Local
SSH	Local	--	--

Figure 13 Authentication Login Configuration

Service Type

Configuration options: Web/Console/Telnet/SSH

Function: Select access mode to switch.

Authentication1/ Authentication2/ Authentication3

Configuration options: --/local/tacacs/radius

Default configuration: local

Function: The methods from left to right are Authentication1, Authentication2, and Authentication3. Select the order of authentication. Authentication method 1 is first performed. If the authentication fails, authentication method 2 is conducted. If both authentications method 1 and authentication method 2 fail, authentication method 3 is conducted.

Description: -- means authentication is disabled and login is not possible. **local** means using username and password set in local to perform authentication. **tacacs** means using the username and password set in TACACS+ server for authentication. **radius** means using the username and password set in RADIUS server for authentication.

Caution:

If tacacs/radius is selected for Authentication1 and Authentication 2, it is recommended to configure Authentication 3 as local. This will enable the management client to login switch vis the local user if none of the configured remote authentication servers are alive.

4 System

4.1 Basic Information

System information includes Device Type, Device Name, MAC Address, Hardware Version, Logic Version, Software Version, Code Date, CPU Used, Memory Used, System Date, System Uptime, Contact and Location, as shown below.

Path: Home >> System >> Basic Information

{ User name, Password }

Configuration range: { 1~63 characters, 1~63 characters }

Description: Input the user name and password created on FTP server.

Caution:

➤When using FTP to transfer files, you need to configure the FTP user name, password, and FTP server IP address and file name..

➤ In the file transmission process, keep FTP server software running.

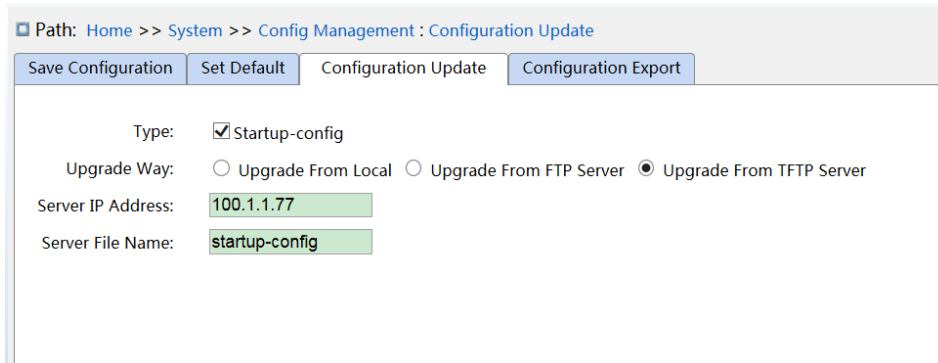

Figure 22 Download Configuration File-TFTP

You can download the configuration file from local /server to switch as a new startup file for the switch. The new startup file will replace the original **startup-config** file. Click <Update> to download the configuration file from local /server to switch.

4.3 Clock management

1. Set DST, as shown below.

In order to make full use of daylight and save energy in summer, you can use DST (DST: Daylight Saving Time) . DST configuration is divided into recurring and non-recurring configuration.

Path: Home >> System >> Clock Management : Set Time

Set Time | NTP | SNTP

Time Zone		GMT 00:00							
Summer Time	Status	<input type="radio"/> Disable <input checked="" type="radio"/> Recurring <input type="radio"/> Non-Recurring							
	Start Time	1	Week	Mon	Jan	0	Hour	0	Min
	End Time	1	Week	Mon	Jan	0	Hour	0	Min
	Offset	1 (1~1439Min)							

Apply

Figure 23 recurring configuration

Path: Home >> System >> Clock Management : Set Time

Set Time | NTP | SNTP

Time Zone		GMT 00:00					
Summer Time	Status	<input type="radio"/> Disable <input type="radio"/> Recurring <input checked="" type="radio"/> Non-Recurring					
	Start Time	Jan	1	Day 2014	Year 0	Hour 0	Min
	End Time	Jan	1	Day 2097	Year 0	Hour 0	Min
	Offset	1 (1~1439Min)					

Apply

Figure 24 Non-recurring configuration

Time zone

Function: select local time zone.

DST status

Configuration options: disable/recurring/non-recurring

Default configuration: disable

Function: Whether enable daylight saving time, after enable, select DST mode, recurring mode by year.

Start time/end time

Function: after enabling DST, set the time range of DST. Non-recurring mode configure year, month, day, hour and minute to appoint the operation range of DST, as shown Figure 23 set DST between 00:00 on 1 January in 2014 and 23:59 on 1 July in 2097. Recurring mode

configure month, week, date, hour and minute to appoint the operation range of DST per year, as Figure 22 set DST between 00:00 on the first Monday in January and 23:59 on the first Monday in July per year.

Offset

Configuration range: 1~1439min

Default configuration: 1min

Function: configurate DST offset, that is start time of DST, and advanced time.

Caution:

- The start time and end time should be different:
- The start time is non-DST time, the end time is DST time.

Example: the DST time from 10:00:00 on April 1 to 9:00:00 on October 1, so the DST offset is 60 min.

Non-DST time runs to 10: 00: 00 on April 1 and jumps directly to 11: 00: 00 DST to begin DST. When DST runs to 9: 00: 00 on October 1, it returns to 8: 00: 00 non-DST.

2、NTP configuration

NTP (network time protocol) is used to synchronize time between the distributed time server and the client. NTP can synchronize the clock of all devices with clock in the network, so that the clock of all devices in the network is same. So that the device can provide a variety of applications based on the same time. For the local system running NTP, it can receive synchronization from other clock sources or synchronize other clocks as clock sources.

Path: Home >> System >> Clock Management : NTP

Set Time NTP SNTP

NTP Status: Enable

Server Address 1:

Server Address 2:

Server Address 3:

Server Address 4:

Server Address 5:

Apply

Figure 25 NTP configuration

NTP status

Configuration options: enable/disable

Default configuration: disable

Function: Whether enable global NTP services.

Caution:

- NTP and SNTP protocol mutually exclusive. Because NTP and SNTP use the same UDP port , both cannot be enabled at the same time;
- When NTP services are disable, NTP services can be configured and saved, that is, the enable or disable NTP services does not affect the configuration of NTP services.

Server address 1/ server address 2/ server address 3/ server address 4/ server address 5

Configuration format: A.B.C.D

Function: Configure the IP address of the NTP server, and the client will calibrate time according to NTP server's message.

3、SNTP configuration

SNTP(Simple Network Time Protocol)protocol calibrates time by requesting and responding between the server and the client. The switch as a client calibrate the time according to the server's message.

**Caution:**

- When the switch enables SNTP, the SNTP server should be active.
 - The time information in SNTP protocol is standard time information of the 0 time zone.
-

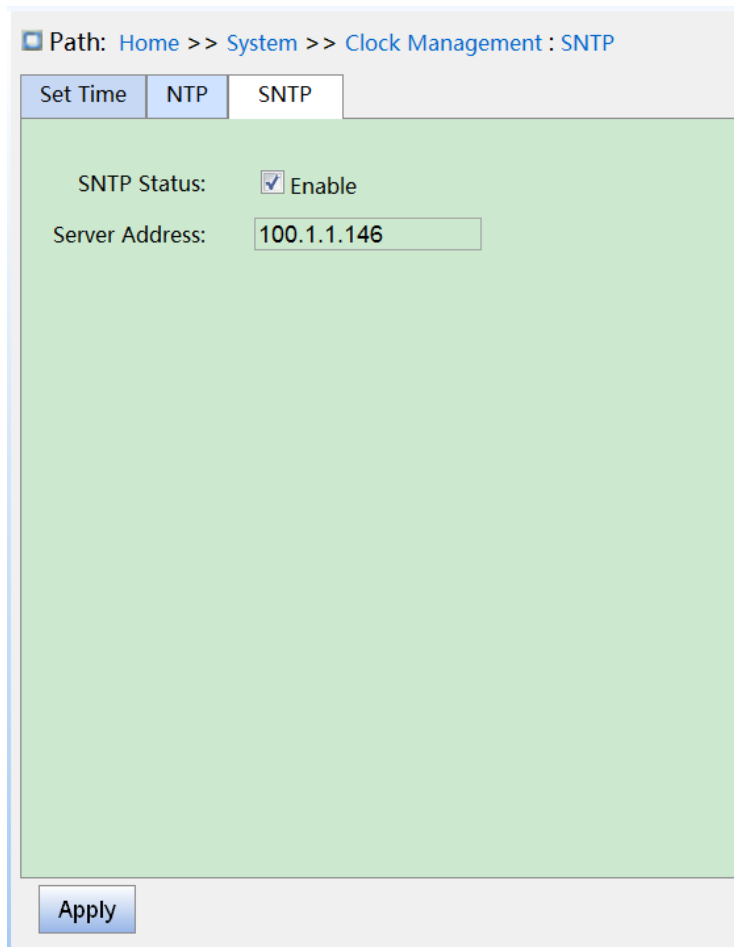

Figure 26 SNTP configuration

SNTP status

Configuration options: enable/disable

Default configuration: diable

Function: Whether enable SNTP.

Server address

Configuration format: A.B.C.D

Function: Configure the IP address of the SNTP server, and the client will calibrate time according to the servier’s message.

4. Check if the switch time is synchronized with server time.

Click on the navigation tree [system] → [basic information] to view system time information,

as shown below.

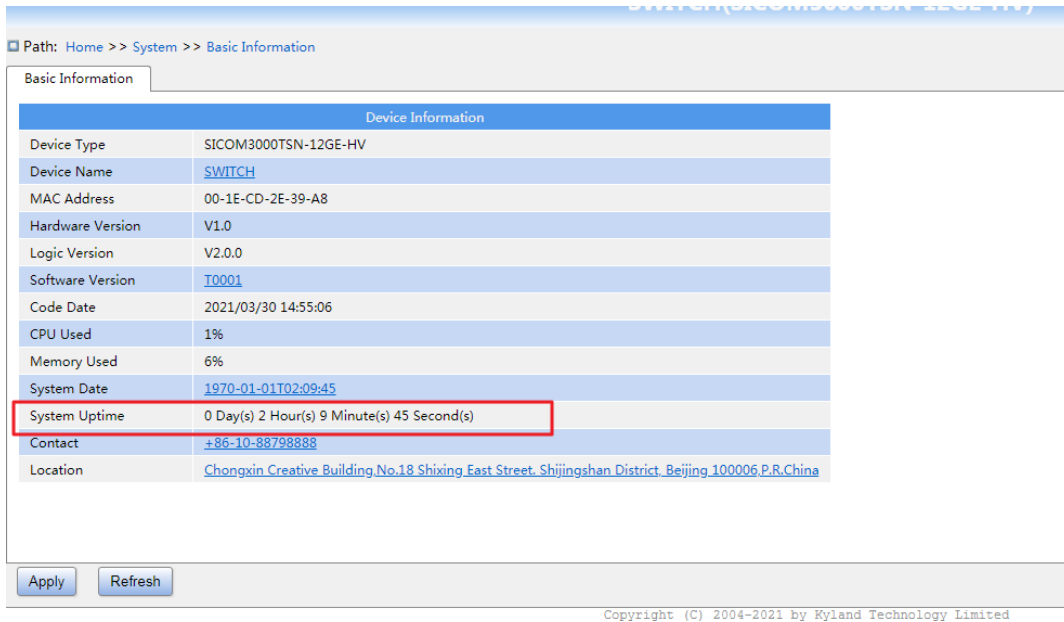

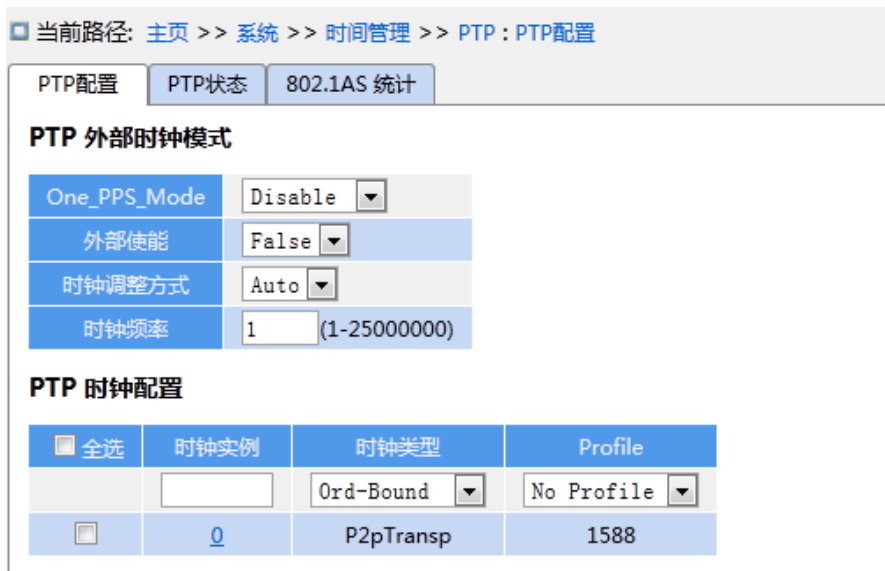

Figure 27 view clock informaton

View switch time information according to server time, time zone and DST configuration.

5、 Ptp clock configuration

Clock type

- Ord-Bound: Configure as BC mode;
- P2pTransp: Configure as point-to-point TC mode;

E2eTransp: Configure as end-to-end TC mode;

Mastronly: Configure as OC master;

Slaveonly: Configure as OC salve;

Profile

1588: Support 1588 protocol;

802.1AS: Support 1AS protocol.

4.4 Software update

Switches can achieve better performance by upgrading software versions. This series of switch upgrades include boot version upgrade and software version upgrade, first upgrade the boot version then upgrade the software version, only the software version is upgraded when the boot version remains the same. The software version can be upgraded through the Local/FTP/TFTP protocol.

4.4.1 Local update

1. Local upgrade software, as shown below.

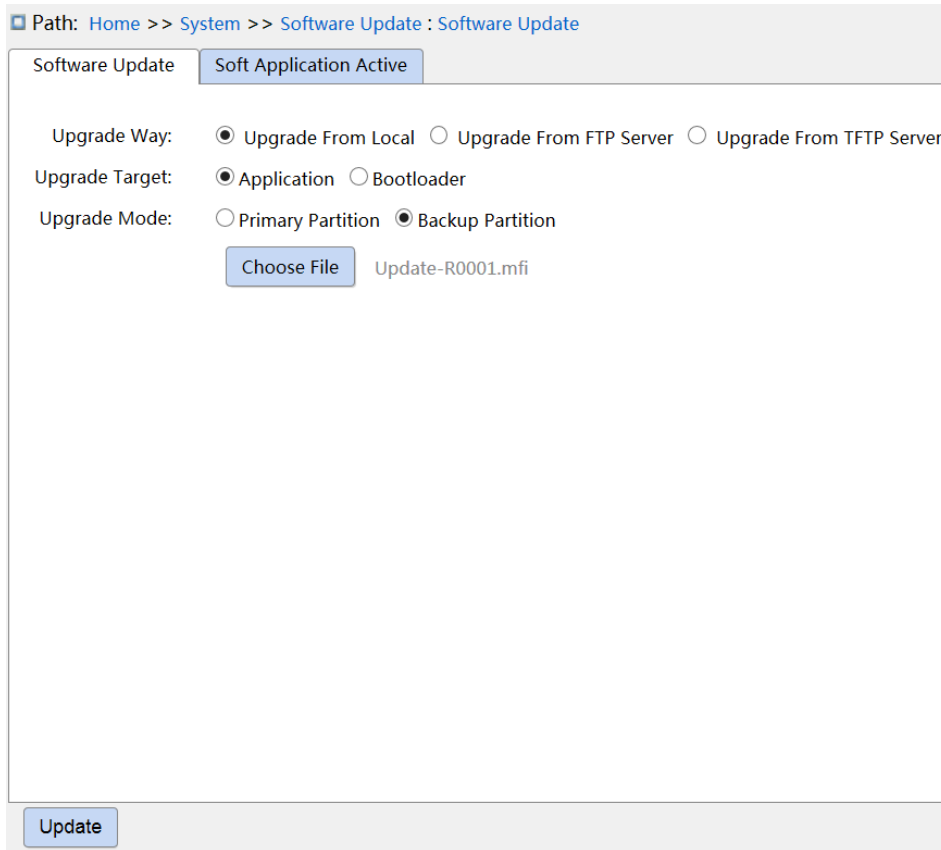

Figure 28 upgrade software-Local

Upgrade way

Configuration options: upgrade from local/upgrade from FTP server/ Upgrade From TFTP Server

Function: select upgrade way.

Upgrade target

Configuration options: software version/Boot version

Function: select upgrade target.

Upgrade mode

Configuration options: primary partition/backup partition

Description: two versions of software can be downloaded, the two versions can be the same or different.

2. After upgrading successfully, as shown in figure 28, activate the software version and

restart the device, then check if the software version is the upgraded version in the system information.

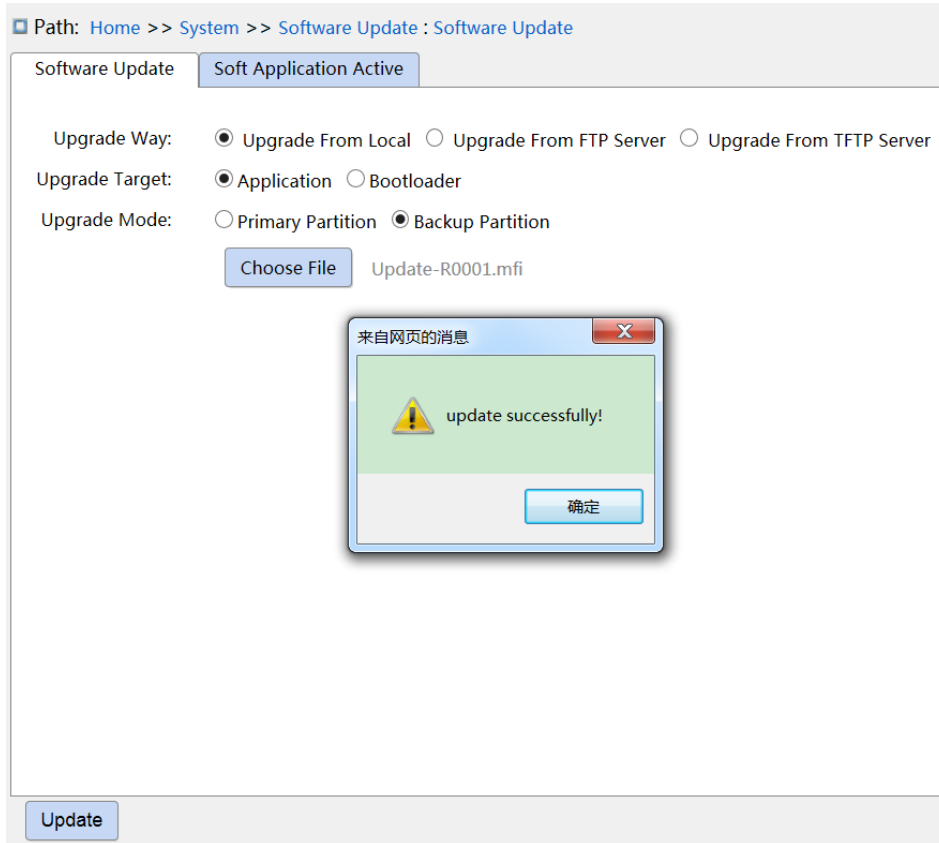

Figure 29 upgrade successfully

Warning:

- After the software upgrade is successful, you must activate the software version and restart the device before the software version can take effect;
- Cannot restart switch after upgrade failure, avoid version file loss and device can not start normally.

4.4.2 FTP upgrade

Install an FTP server. The following uses WFTPD software as an example to introduce FTP server configuration and software update.

1. Click [Security] → [Users/Rights]. The "Users/Rights Security Dialog" dialog box is

displayed. Click <New User> to create a new FTP user, as shown in Figure 30. Create a user name and password, for example, user name "admin" and password "123". Click <OK>.

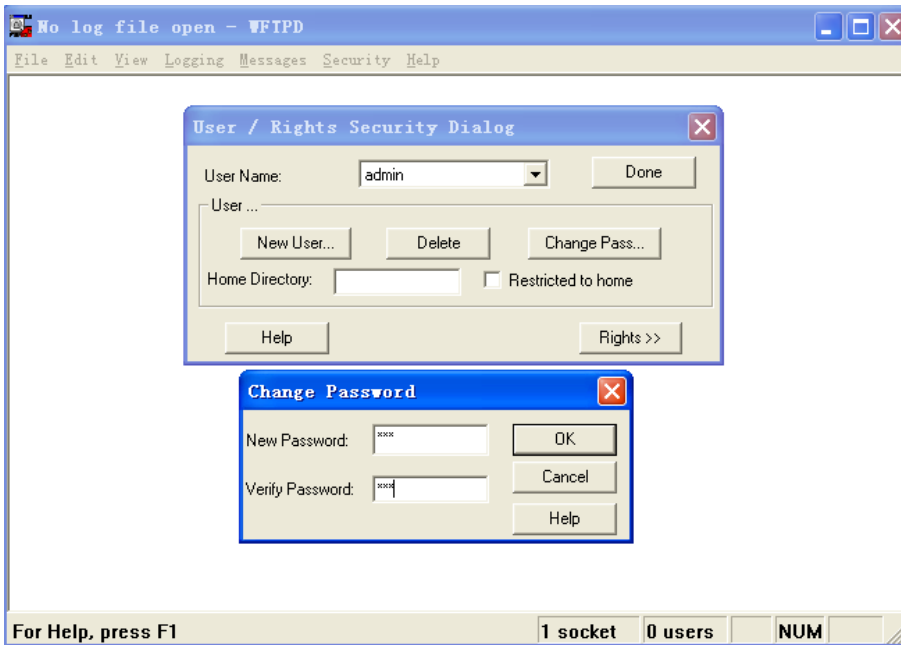

Figure 30 Creating a New FTP User

2. Input the storage path of the update file in "Home Directory", as shown in Figure 31. Click <Done>.

Figure 31 File Location

3. Click [System] → [Software Update] in the navigation tree to enter the software update page, as shown in Figure 32. Enter the IP address of FTP server, FTP user name, password, and file name on the server. Click <Update>.

Path: Home >> System >> Software Update : Software Update

Configuration options: Upgrade From Local / Upgrade From FTP Server/ Upgrade From TFTP Server

Explanation: Select upgrade mode

Upgrade Target

Configuration options: Application/Bootloader

Function: Select the upgrade target.

Upgrade Mode

Configuration options: Primary Partition/Backup Partition

Description: Two firmware versions can be downloaded to the switch, and they can be the same or different.

Warning:

➤ The file name must contain an extension. Otherwise, the update may fail.

4. Make sure the normal communication between the FTP server and the switch, as shown below.

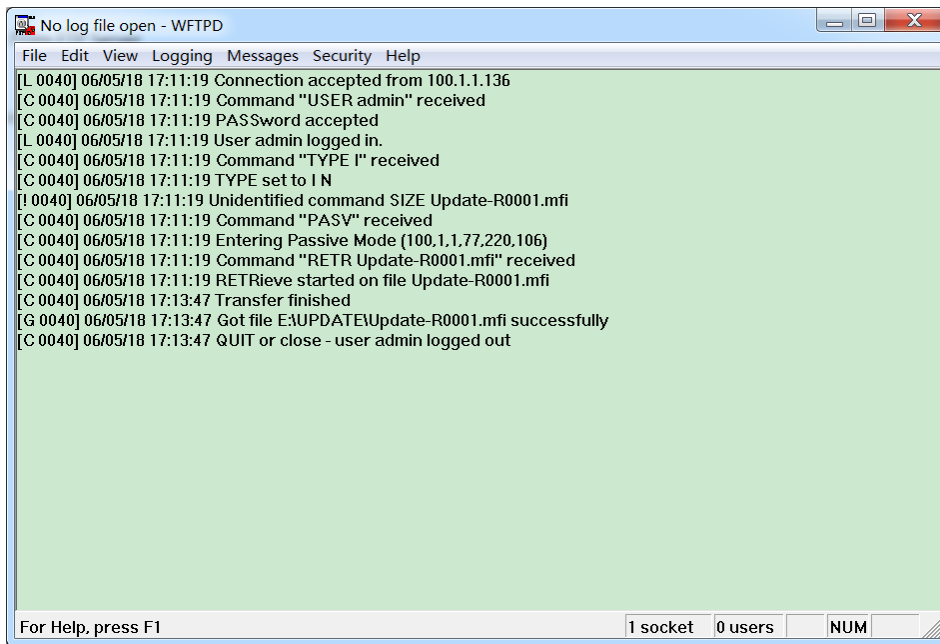

Figure 33 Normal Communication between FTP Server and Switch

Caution:

To display update log information as shown in Figure 33, you need to click [Logging] → [Log Options] in WFTPD and select Enable Logging and the log information to be displayed.

5. Wait for the update to complete, as shown in Figure 34;

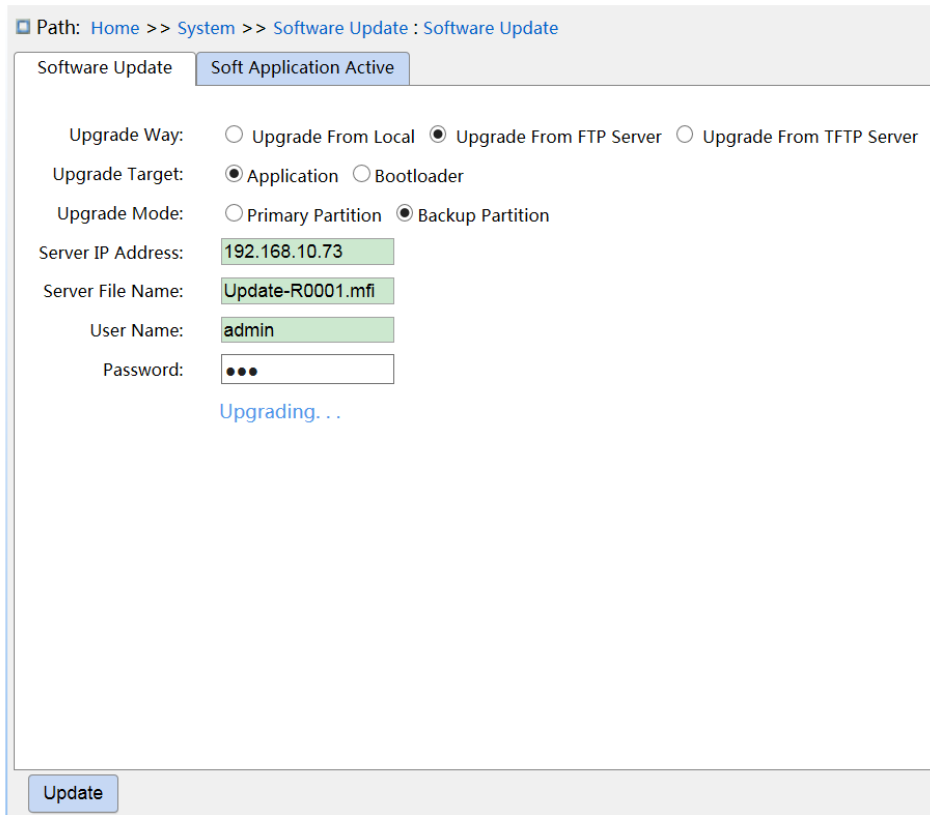

Figure 34 Waiting for the Update to Complete

6. When the update is completed, please reboot the device and open the Switch Basic Information page to check whether the update succeeded and the new version is active.

Warning:

- In the software update process, keeps the FTP server software running.
- When update completes, reboot the device to activate the new version.
- If update fails, do not reboot the device to avoid the loss of software file and startup anomaly.

4.4.3 TFTP upgrade

Install TFTP server. The following uses TFTP software as an example to introduce TFTP server configuration.

Figure 35 TFTP Server Configuration

1. In "Current Directory", select the storage path of update file on server. Enter the server IP address in "Server interface".
2. Click [System] → [Software Update] in the navigation tree to enter the software update page, as shown below. Enter the IP address of the TFTP server and file name on server. Click <Update>, and wait for update to complete.

Path: Home >> System >> Software Update : Software Update

Software Update Soft Application Active

Upgrade Mode: Primary Partition Backup Partition

Server IP Address: 192.168.10.73

Server File Name: Update-R0001.mfi

Update

Figure 36 Software Update by TFTP

3. Make sure the normal communication between the TFTP server and the switch, as shown below.

Figure 37 Normal Communication between TFTP Server and Switch

4. Wait for the update to complete, as shown below.

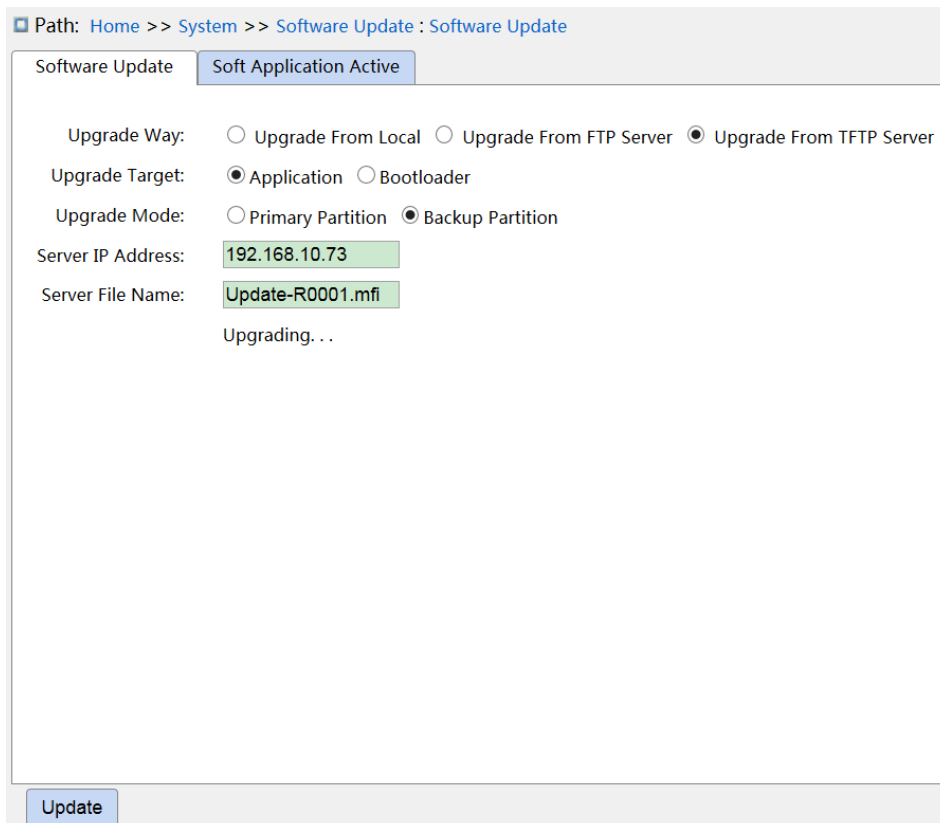

Figure 38 Waiting for Update to Complete

5. When the update is completed, please reboot the device and open the Switch Basic Information page to check whether the update succeeded and the new version is active.

Warning:

- In the software update process, keeps the TFTP server software running.
- When update completes, reboot the device to activate the new version.
- If update fails, do not reboot the device to avoid the loss of software file and startup anomaly.

4.5 Soft Application Active

Activate the firmware application, as shown in Figure 39.

Path: Home >> System >> Software Update : Soft Application Active

Software Update Soft Application Active

Application Selected	Current Startup	Application Version	Version
<input type="radio"/>		Primary Partition	R0001
<input checked="" type="radio"/>	✓	Backup Partition	R0001

Apply

Figure 39 Activate the firmware application

Select one version and click <Apply> button, configuring the version to be active version that is the next startup version. Only one can be active version at a time.

Current Startup indicates the version is current running version.

4.6 Language Update

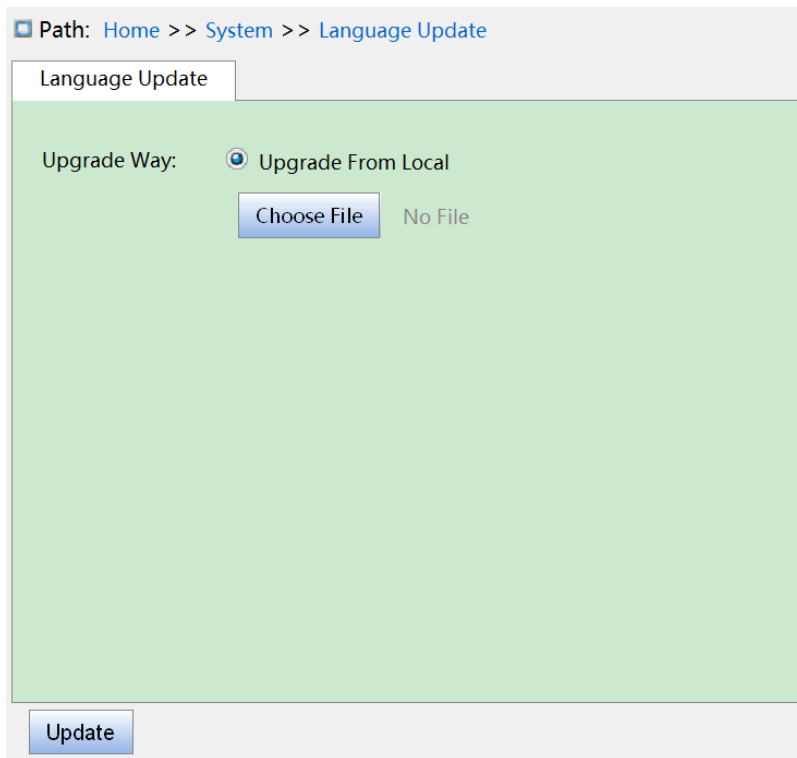

Figure 40 Update language

Upgrade way

Configuration options: upgrade from local

Function : Download language packs to devices that support multiple language access.

4.7 Restart

Restart device, as shown below.

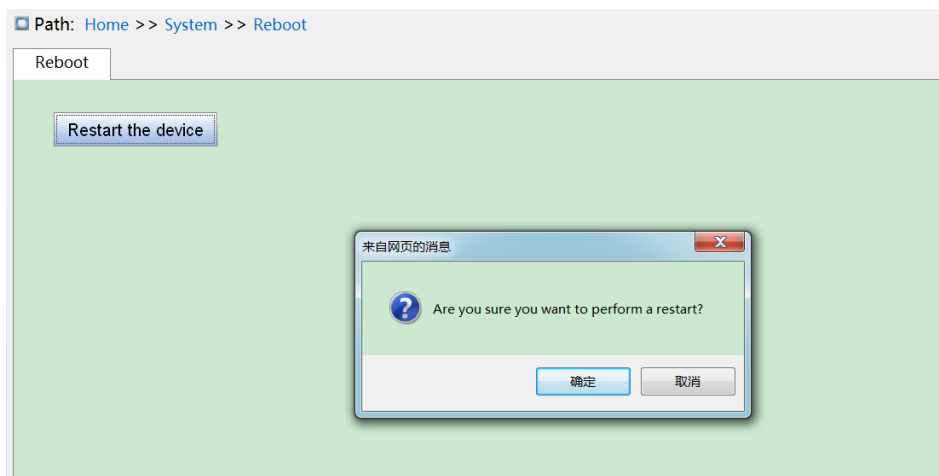

Figure 41 restart device

Before restarting the device, confirm whether save the current configuration, the switch configuration is the latest information after reboot, and if not, the switch configuration will be restored to the factory Default configuration after reboot.

4.8 Abort

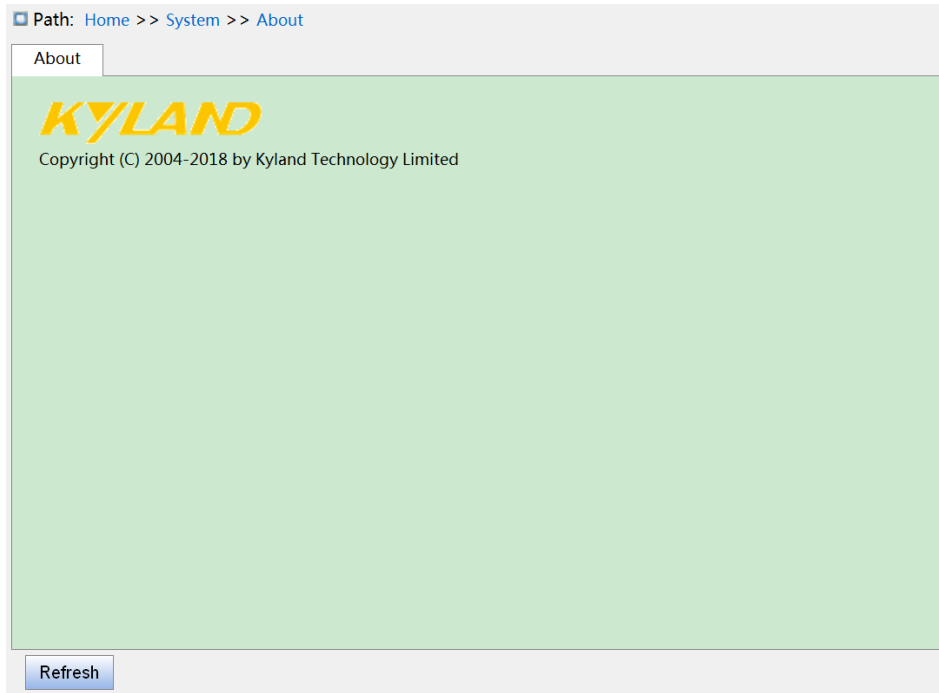

Figure 42 System related information

5 Service

5.1 SSL Configuration

5.1.1 Introduce

SSL (Secure Socket Layer) is a security protocol and provides the security link for the TCP-based application layer protocol, such as HTTPS. SSL encrypts the network connection at the transport layer and uses the symmetric encryption algorithm to guarantee the data security, and uses the secret key authentication code to ensure the information reliability. This protocol is widely used in Web browser, receiving and sending emails, network fax, real time communication, and so on, providing an encryption protocol for the security transmission in the network.

5.1.2 Web Configuration

1. Enable HTTPS, as shown below.

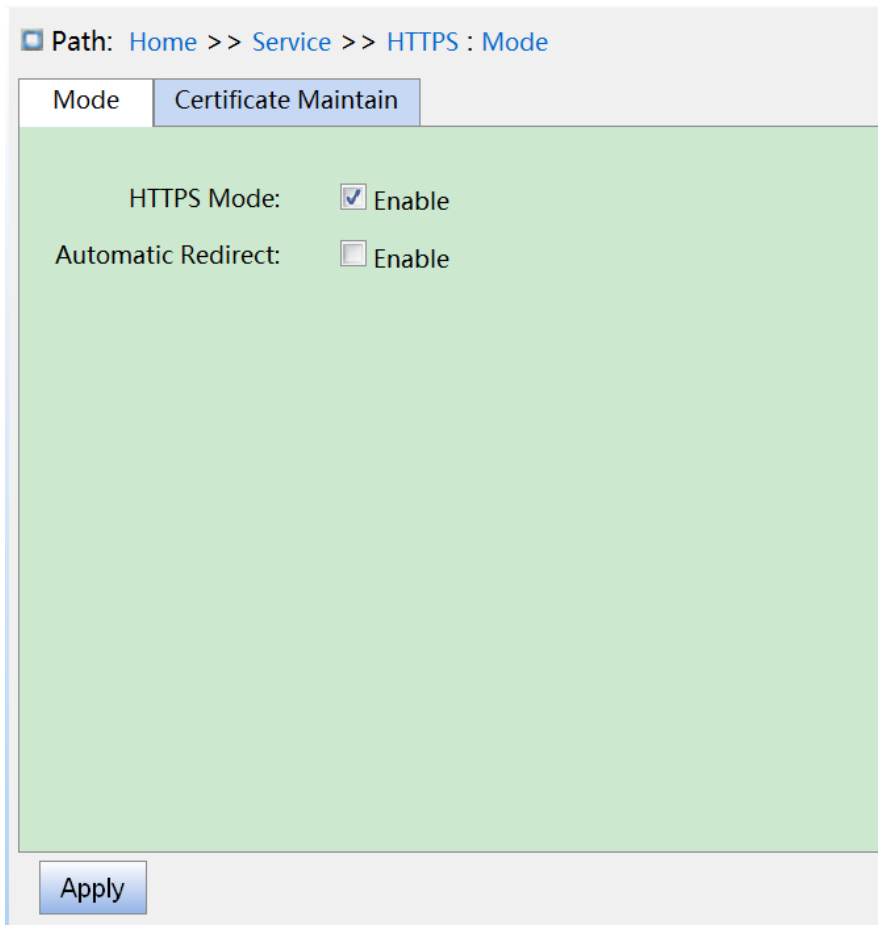

Figure 43 Enable HTTPS

HTTPS Mode

Configuration options: Enable /Disable

Default configuration: Disable

Function: enable or disable HTTPS, if enable, login in the switch Web interface via <http://ip address> and secure link <https://ip address>.

Automatic redirection

Configuration options: Enable /Disable

Default configuration: Disable

Function: if enable, only secure link <https://ip address> is allowed to login switch web pages. If disable, the switch web page can be login via http and https. The automatic redirect

parameter only can be configured when the https status is enable.

2. Certificate management, as shown below.

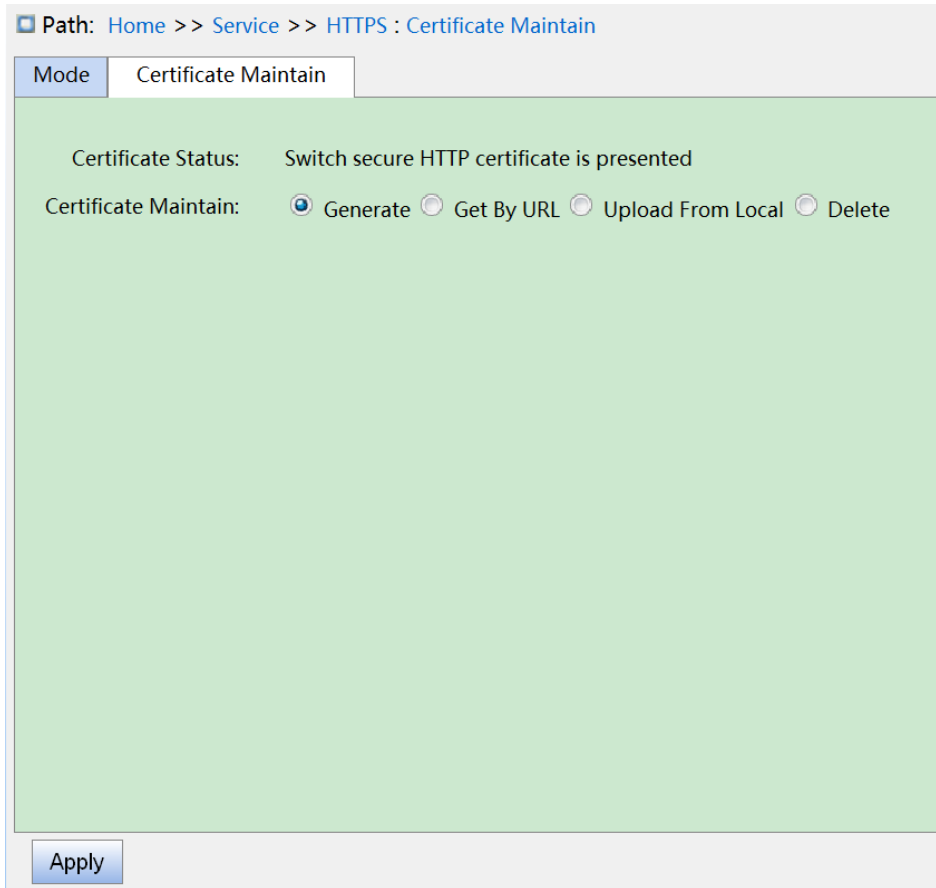

Figure 44 Generate certificate

Maintain

Configuration options: Generate/Get by URL/Upload from local/Delete

Function: select upload mode of certificate

Get certificate by URL

URL

Function: set web path such as https://10.10.10.10:80/new_image_path/new_image.dat

Upload from local

Select file

Function: select HTTPS certificates file from local.

5.2 SNMP v1/SNMP v2c

5.2.1 Introduction

The Simple Network Management Protocol (SNMP) is a framework using TCP/IP to manage network devices. With the SNMP function, the administrator can query device information, modify parameter settings, monitor device status, and discover network faults.

5.2.2 Implementation

SNMP adopts the management station/agent mode. Therefore, SNMP involves two types of NEs: NMS and agent.

The Network Management Station (NMS) is a station running SNMP-enabled network management software client. It is the core for the network management of an SNMP network.

Agent is a process in the managed network devices. It receives and processes request packets from the NMS. When an alarm occurs, the agent proactively reports it to the NMS. The NMS is the manager of an SNMP network, while agent is the managed device of the SNMP network. The NMS and agents exchange management packets through SNMP.

SNMP involves the following basic operations:

Get-Request

Get-Response

Get-Next-Request

Set-Request

Trap

The NMS sends Get-Request, Get-Next-Request, and Set-Request packets to agents to query, configure, and manage variables. After receiving these requests, agents reply with Get-Response packets. When an alarm occurs, an agent proactively reports it to the NMS with a trap packet.

5.2.3 Explanation

This series switches support SNMP v2c. SNMP v2c is compatible with SNMPv1.

SNMP v1 uses community name for authentication. A community name acts as a password, limiting NMS's access to agents. If the community name carried by an SNMP packet is not acknowledged by the switch, the request fails and an error message is returned.

SNMP v2c also uses community name for authentication. It is compatible with SNMP v1, and extends the functions of SNMP v1.

To enable the communication between the NMS and agent, their SNMP versions must match. Different SNMP version can be configured on an agent, so that it can use different versions to communicate with different NMSs.

5.2.4 MIB Introduction

Any managed resource is called managed object. The Management Information Base (MIB) stores managed objects. It defines the hierarchical relationships of managed objects and attributes of objects, such as names, access permissions, and data types. Each agent has its own MIB. The NMS can read/write MIBs based on permissions. Figure 45 shows the relationships among the NMS, agent, and MIB.

Figure 45 Relationship among NMS, Agent, and MIB

MIB defines a tree structure. The tree nodes are managed objects. Each node has a unique Object Identifier (OID), which indicates the location of the node in the MIB structure. As shown in Figure 46, the OID of object A is 1.2.1.1.

Figure 46 MIB Structure

5.2.5 Web Configuration

1. Enable SNMP, as shown below.

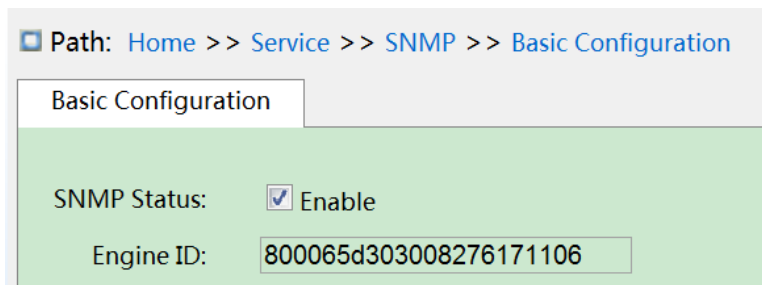

Figure 47 Enable SNMP

SNMP status

Configuration options: Enable/Disable

Default configuration: Enable

Function: Enable or disable SNMP.

Engine ID

Configuration range: hexadecimal number is even, can not be all 0 or F, the value range of even number is 10~64.

Function: Configure SNMP v3 system engine ID, the user corresponding to the device ID in the user table will be clear when the engine ID is modified.

2. Configure Community, as shown below.

Path: Home >> Service >> SNMP >> Community Configuration

Community Configuration

Apply

Figure 48 Configure Community

Community

Configuration range: 1~32 characters

Function: configure the community of switch.

Description: The MIB library information of the switch can only be accessed when the community name in the snmp message is consistent with the community string.

Note: up to 16 community strings can be configured.

Access Priority

Configuration options: Read Only/Read And Write

Default configuration: Read Only.

Function: configure the access priority of MIB library.

Description: the MIB library information only can be ready with read-only permissions; the

MIB library information can be read with read and write permissions.

3. Configure trap, as shown below.

Figure 49 Configure trap

Trap name

Configuration range: 1~32 characters

Function: configure trap name.

status

Configuration options: enable/disable

Default configuration: disable

Function: enable or disable trap, the switch sends the corresponding trap message to the server if enable.

Version

Configuration options: SNMP v1/SNMP v2c/SNMP v3

Default configuration: SNMP v1

Function: configure the trap message version number that the switch sends to the server.

Destination IP

Configuration format: A.B.C.D

Function: Configure the server address where the trap message is received.

Destination Port

Configuration range: 1~65535

Default configuration: 162

Function: Configure the port number that sends the trap message.

4. Click on the trap configuration item details to see the trap configuration details, as shown below.

Apply

Figure 51 trap source configuration

System warm start/cold start

Configuration options: enable/disable

Default configuration: disable

Function: Whether to send trap message when the system is warm start / cold start.c

RMON falling alarm/rising alarm

Configuration options: enable/disable

Default configuration: disable

Function: Whether to send a trap message when the RMON generates a falling alarm / rising alarm.

STP new root/ topology change

Configuration options: enable/disable

Default configuration: disable

Function: Whether to send the trap message when the state of STP changes.

Port link up/down

Configuration options: enable/disable

Default configuration: disable

Function: Whether to send trap message of port up/down when port status changes.

Alarm

Configuration options: enable/disable

Default configuration: disable

Function: When there is alarm information, whether to send trap message.

SNMP authentication fail

Configuration options: enable/disable

Default configuration: disable

Function: If snmp authentication fails, whether to send trap message.

LLDP

Configuration options: enable/disable

Default configuration: disable

Function: Whether to send LLDP trap message when the neighbor status changes.

5.2.6 Typical Configuration Example

SNMP management server is connected to the switch through Ethernet. The IP address of the management server is 192.168.0.23, and that of the switch is 192.168.0.2. The NMS monitors and manages the Agent through SNMP v2c, and reads and writes the MIB node information of the Agent. When the Agent is faulty, it proactively sends trap packets to the NMS, as shown in Figure 52.

Figure 52 SNMP v2c Configuration Example

Configuration on Agent:

1. Enable SNMP and v2c state; configure access rights with Read only community "public" and Read and write community "private", as shown in Figure 47、 Figure 48.
2. Configure global trap mode, as shown in Figure 49.
3. Create trap entry 111, enable trap mode; set the trap version to SNMP v2c, destination IP address to 192.168.0.23. Select system, interface, authentication, and switch all trap events, and adopt default settings for the other parameters, as shown in Figure 50、 Figure 51.

If you want to monitor and manage Agent devices, run the corresponding management software in NMS, such as Kyvision developed by Kyland.

For details about operations of Kyvision, refer to the *Kyvision Operation Manual*.

5.3 SNMPv3

5.3.1 Introduce

SNMP v3 provides a User-Based Security Model (USM) authentication mechanism. You can configure authentication and encryption functions. Authentication is used for verifying the

validity of packet sender, preventing illegitimate users' access. Encryption is used for encrypt packets transmitted between the NMS and the Agent, avoiding interception. The authentication and encryption functions can improve the security of communication between the SNMP NMS and the SNMP Agent.

To enable the communication between the NMS and agent, their SNMP versions must match. Different SNMP version can be configured on an agent, so that it can use different versions to communicate with different NMSs.

5.3.2 Implementation

SNMP v3 provides four configuration tables. Each table can contain 16 entries. These tables determine whether specific users can access MIB information.

You can create multiple users in the user table. Each user uses different security policies for authentication and encryption.

The group table is the collection of multiple users. In the group table, access rights are defined based on user groups. All the users of a group have the rights of the group.

The view table refers to the MIB view information, which specifies the MIB information that can be accessed by users. The MIB view may contain all nodes of a certain MIB subtree (that is, users are allowed to access all nodes of the MIB subtree) or contain none of the nodes of a certain MIB subtree (that is, users are not allowed to access any node of the MIB subtree).

You can define MIB access rights in the access table by group name, security model, and security level.

5.3.3 Web Configuration

1. Enable SNMP, as shown below.

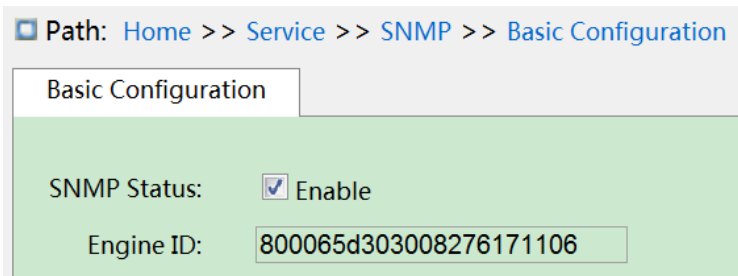

Figure 53 enable SNMP

SNMP Status

Configuration options: enable/disable

Default configuration: disable

Function: enable or disable SNMP.

Engine ID

Configuration range: hexadecimal number is even, can not be all 0 or F, the value range of even number is 10~64.

Function: Configure SNMP v3 system engine ID, the user corresponding to the device ID in the user table will be clear when the engine ID is modified.

2. Configure trap, as shown below.

Figure 54 Configure Trap

Trap name

Configuration range: 1~32 characters

Function: configure trap name.

Status

Configuration options: enable/disable

Default configuration: disable

Function: enable or disable trap, the switch sends the corresponding trap message to the server if enable.

Version

Configuration options: SNMP v1/SNMP v2c/SNMP v3

Default configuration: SNMP v1

Function: configure the trap message version number that the switch sends to the server.

Destination IP

Configuration format: A.B.C.D

Function: Configure the server address where the trap message is received.

Destination port

Configuration range: 1~65535

Default configuration: 162

Function: Configure the port number that sends the trap message.

3. Click on the trap configuration item details to see the trap configuration details, as shown below.

Alarm

Configuration options: enable/disable

Default configuration: diable

Function: When there is alarm information, whether to send trap message.

SNMP authentication fail

Configuration options: enable/disable

Default configuration: diable

Function: If snmp authentication fails, whether to send trap message.

LLDP

Configuration options: enable/disable

Default configuration: diable

Function: Whether to send LLDP trap message when the neighbor status changes.

5. Configure user name table, as shown below.

All	Security Name	Engine ID	Security Level	Authentication Protocol	Authentication Password	Privacy Protocol	Privacy Password
<input type="checkbox"/>	test	800065d303008276171106	NoAuthNoPriv	SHA	*****	--	--
<input type="checkbox"/>	test1	800065d303008276171106	AuthPriv	MD5	*****	DES	*****

Figure 57 configure SNMPv3 user name table

Security Name

Configuration range: 1~32 characters

Function: Create user name.

Engine ID

Configuration range: hexadecimal number is even, can not be all 0 or F, the value range of even number is 10~64.

Function: Configure the security engine ID value which is carried in the SNMP v3 trap message.

Security Level

Configuration options: NoAuthNoPriv/AuthNoPriv/AuthPriv

Function: Configure the security level of the current user.

Description: NoAuthNoPriv requires neither authentication nor encryption, AuthNoPriv need to authenticate but not to encrypt, AuthPriv requires both authentication and encryption.

Authentication Protocol

Configuration options: MD5/SHA

Function: Select an authentication protocol. When selecting authnopriv/authpriv at the security level, you need to configure the authentication protocol and authentication password.

Authentication Password

Configuration range: 8~40 characters (MD5 protocol) 8~32 characters (SHA protocol)

Function: Create authentication password.

Privacy Protocol

Configuration options: DES/AES

Function: Select a privacy protocol. The privacy protocol and password need to be configured when selecting Auth, Priv at the security level.

Privacy Password

Configuration range: 8~32 characters

Function: Create privacy password.

Up 16 users can be configured.

5. Configure group table, as shown below.

Path: Home >> Service >> SNMP >> V3 Detail : V3 Group Table

Figure 60 Configure SNMPv3 access table

Group Name

Configuration range: Created group name, 1~32 characters

Description: All users in a group have the same access authority.

Security Model

Default configuration: any/v1/v2/usm

Function: Select the security model for the current group access switch (that is SNMP version number), SNMPv3 use USM (security model based on user) technology. Any refers to use any security model. Group name, security model configuration should be consistent with group name and security model in group table.

Security level

Configuration options: NoAuthNoPriv/AuthNoPriv/AuthPriv

Function: Configure the security level of current group.

Description: NoAuthNoPriv requires neither authentication nor encryption, AuthNoPriv need to authenticate but not to encrypt, AuthPriv requires both authentication and encryption. When encryption is needed, the authentication / encryption protocol, the authentication / encryption password on the NMS side should be consistent with the configuration of the user table, then the node information of the switch can be accessed successfully.

The security level of NoAuthNoPriv、AuthNoPriv、AuthPriv increment in turn, a low level of security allows it can be accessed by a high level of security. If a group is configured the security level as AuthNoPriv, users with a security level as AuthNoPriv and AuthPriv in this group can successfully access the switch if both the authentication / encryption protocol and the authentication / encryption password are correct, but users with a security level as NoAuth/ NoPriv cannot access the switch.

Read View

Configuration options: default_view/None/Created view name

Function: Select read only view name.

Write View

Configuration options: default_view/None/Created view name

Function: Select read and write view name.

Up 16 access tables can be configured.

Note:

The default access tables in the switch {default_ro_group, any, NoAuth,NoPriv, default_view, None}、 {default_rw_group, any, NoAuth,NoPriv, default_view, default_view}.

5.3.4 Typical Configuration Example

SNMP management server is connected to the switch through Ethernet. The IP address of the management server is 192.168.0.23, and that of the switch is 192.168.0.2. User 1111 and user 2222 manage the Agent through SNMP v3. Security level is set to AuthNoPriv, and the switch can perform read-only operation on all node information of the Agent. When an alarm occurs, the Agent sends trap v3 messages to the NMS proactively, as shown in Figure 61.

Figure 61 SNMP v3 Configuration Example

Configuration on the Agent:

1. Enable SNMP and v3 state, as shown in Figure 53.
2. Configure the SNMP v3 user table
Set a user name to 1111, security level to Auth,Priv, authentication protocol to MD5, authentication password to aaaaaaaa, privacy protocol to DES, and privacy password to xxxxxxxx.
Set another user name to 2222, security level to Auth,Priv, authentication protocol to SHA, authentication password to bbbbbbbb, privacy protocol to AES, and privacy password to yyyyyyyy, as shown in Figure 57.
3. Create group, set security model to usm, and add user 1111 and user 2222 to the group, as shown in Figure 58.
4. Configure the SNMP v3 access table

Set the group name to group, security model to usm, security level to Auth,NoPriv, read view to default_view, and write view to None, as shown in Figure 60.

5. Enable the global trap mode, as shown in Figure 54.

6. Create trap entry 222, enable trap mode; set the trap version to SNMP v3, destination IP address to 192.168.0.23. Select system, interface, authentication, and switch all trap events, and adopt default settings for the other parameters.

If you want to monitor and manage Agent devices, run the corresponding management software in NMS.

5.4 SSH Configuration

5.4.1 Introduction

SSH (Secure Shell) is a network protocol for secure remote login. It encrypts all transmitted data to prevent information disclosure. When data is encrypted by SSH, users can only use command lines to configure switches.

The switch supports the SSH server function and allows the connection of multiple SSH users that log in to the switch remotely through SSH.

5.4.2 Implementation

In order to realize the SSH secure connection in the communication process, the server and the client experience the following five stages:

Version negotiation stage: currently, SSH consists of two versions: SSH1 and SSH2. The two parties negotiate a version to use.

Key and algorithm negotiation stage: SSH supports multiple types of encryption algorithms. The two parties negotiate an algorithm to use.

Authentication state: the SSH client sends an authentication request to the server and the server authenticates the client.

Session request stage: the client sends a session request to the server after passing the authentication.

Session stage: the client and the server start communication after passing the session

request.

5.4.3 Web Configuration

1. Enable SSH protocol, as shown below.

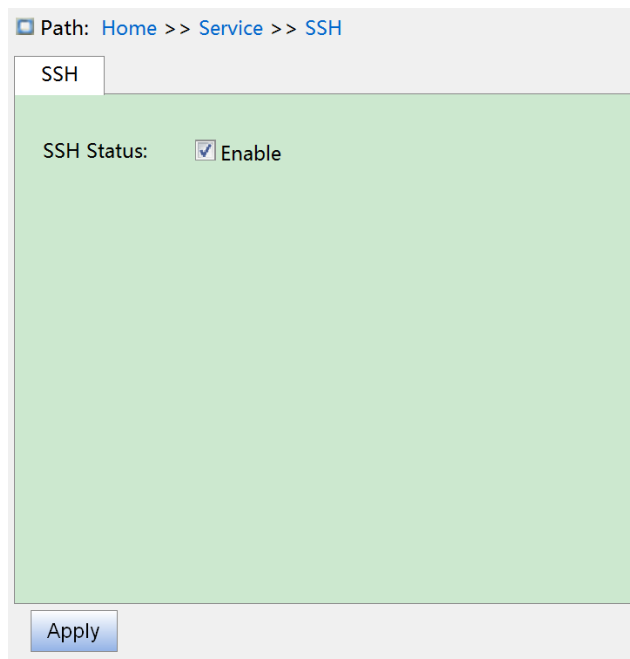

Figure 62 Enable SSH Protocol

SSH Status

Configuration options: Enabled/Disabled

Default configuration: Enabled

Function: Enable/Disable SSH protocol. If it is enabled, the switch works as the SSH server.

5.4.4 Typical Configuration Example

The Host works as the SSH client to establish a local connection with switch, as shown in Figure 63;

Figure 63 SSH Configuration Example

1. Enable SSH protocol, as shown in Figure 62;
2. Establish the connection with the SSH server. First, run the PuTTY.exe software, as shown in Figure 64; input the IP address of the SSH server "192. 168.0.2" in the space of Host Name (or IP address).

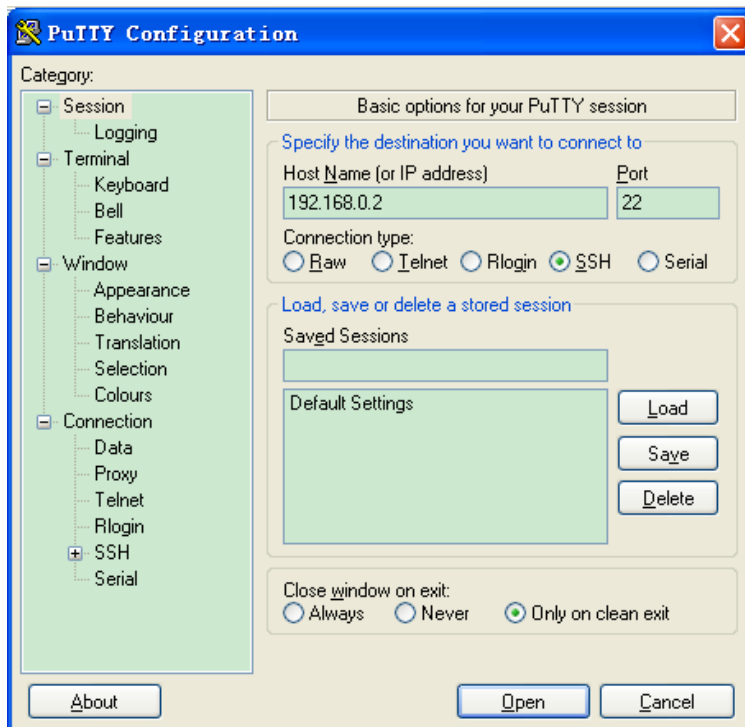

Figure 64 SSH Client Configuration

3. Click <Open> button and following warning message appears shown in Figure 65, click the <是(Y)> button.

Figure 65 Warning Message

4. Input the user name "admin" and the password "123" to enter the switch configuration interface, as shown in Figure 66.

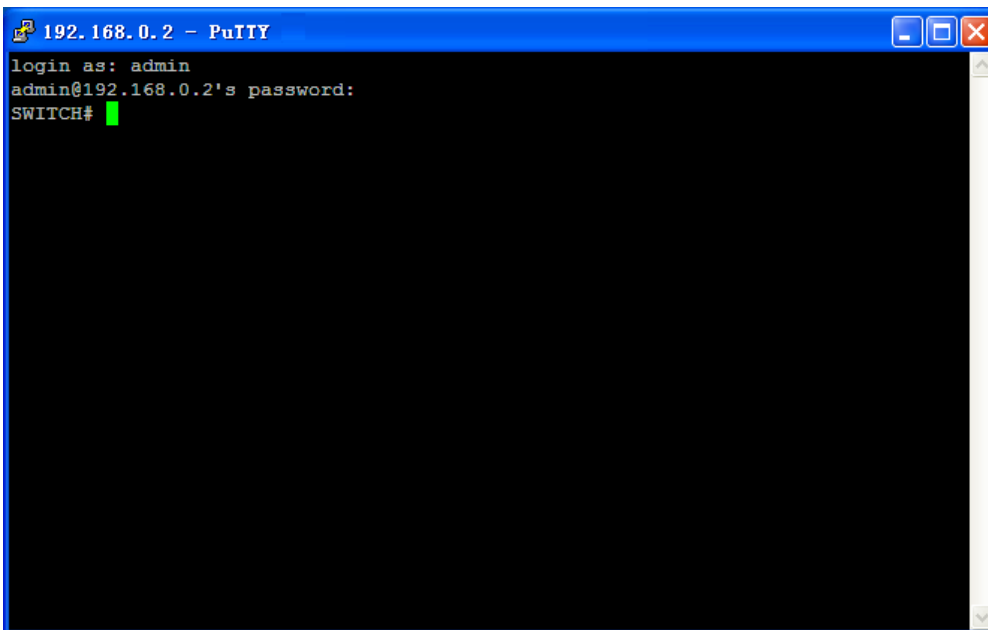

Figure 66 Login Interface of the SSH Authentication

5.5 TACACS+ Configuration

5.5.1 Introduction

Terminal Access Controller Access Control System (TACACS+) is a TCP-based application. It adopts the client/server mode to implement the communication between Network Access Server (NAS) and TACACS+ server. The client runs on the NAS and user information is managed centrally on the server. The NAS is the server for users but client for the server. Figure 67 shows the structure.

Figure 67 TACACS+ Structure

The protocol authenticates, authorizes, and charges terminal users that need to log in to the device for operations. The device serves as the TACACS+ client, and sends the user name and password to the TACACS+ server for authentication. The server receives TCP connection requests from users, responds to authentication requests, and checks the legitimacy of users. If a user passes authentication, it can log in to the device for operations.

5.5.2 Web Configuration

1. Configure the TACACS+ server, as shown below.

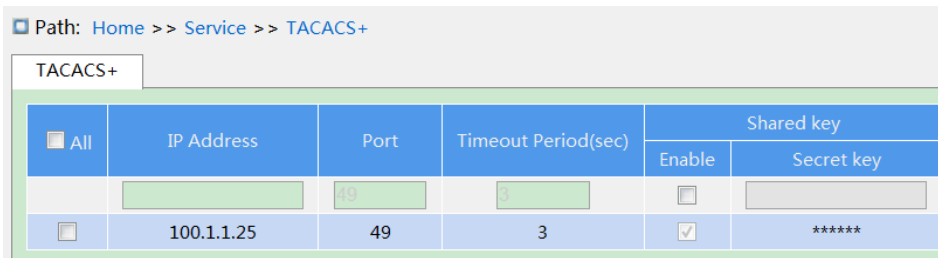

Figure 68 TACACS+ Server Configuration

IP Address

Function: Configure the IP address or hostname of TACACS+ server. A maximum of 5 TACACS+ server can be configured.

Port

Configuration range: 0~65535

Default configuration: 49

Function: Set TCP port of the TACACS+ server for authentication.

Timeout Period(sec)

Configuration range: 1~1000s

Function: Set the overtime for response from the TACACS+ server. After sending a TACACS+ request packet, if the device still receives no response from the TACACS+ server after the specified time, authentication fails, and the device will consider the TACACS+ server is invalid.

Share Key

Configuration range: 0~63 characters

Function: Set the key to improve the communication security between client and TACACS+ server. The two parties share the key to verify the legitimacy of packets. Both parties can receive packets from each other only when the keys are the same. Therefore, make sure the configured key is the same as the key on the TACACS+ server.

5.5.3 Typical Configuration Example

As shown in Figure 69, TACACS+ server can authenticate and authorize users by the switch. The server IP address is 192.168.0.23, and the shared key used when switch and server

exchange packets is aaa.

Figure 69 TACACS+ Authentication Example

1. TACACS+ server configuration. Set the server IP address to 192.168.0.23 and key to aaa, as shown in Figure 68.
2. When logging in to the switch through Web, select "Local", while logging in to the switch through telnet, select "Tacacs+", as shown in Figure 13.
3. Configure username and password "bbb", encrypt key "aaa" on TACACS+ server.
4. When logging in to the switch through Web, input the username "admin" and password "123" to pass the local authentication.
5. When logging in to the switch through Telnet, input the username and password "bbb" to pass the TACACS+ authentication.

5.6 RADIUS Configuration

5.6.1 Introduction

RADIUS (Remote Authentication Dial-In User Service) is a distributed information exchange protocol. It defines UDP-based RADIUS frame format and information transmission mechanism, protecting networks from unauthorized access. RADIUS is usually used in networks that require high security and remote user access.

RADIUS adopts client/server mode to achieve communication between the NAS (Network Access Server) and the RADIUS server. The RADIUS client runs on the NAS. The RADIUS server provides centralized management for user information. The NAS is the server for

users but client for the RADIUS server. Figure 70 shows the structure.

Figure 70 RADIUS Structure

The protocol authenticates terminal users that need to log in to the device for operation. Serving as the RADIUS client, the device sends user information to the RADIUS server for authentication and allows or disallows users to log in to the device according to authentication results.

5.6.2 Web Configuration

1. Configure the RADIUS server, as shown below.

Figure 71 Configure the RADIUS Server

IP Address

Function: Configure the IP address or hostname of RADIUS server. A maximum of 5 RADIUS server can be configured.

Authentication Port

Configuration range: 0~65535

Default configuration: 1812

Function: Set UDP port of the RADIUS server for authentication.

Accounting Port

Configuration range: 0~65535

Default configuration: 1813

Function: Set UDP port of the RADIUS server for accounting. Since RADIUS uses different UDP ports for receiving and sending authentication and accounting messages, different port numbers must be configured for authentication and accounting.

Timeout Peroid(sec)

Configuration range: 1~1000s

Function: Set the overtime for response from the RADIUS server. After sending a RADIUS request packet, the device will retransmit a RADIUS request packet if it still receives no response from the RADIUS server after the specified time.

Retransmission Times

Configuration range: 1~1000

Function: Set the maximum retransmission attempts for RADIUS request packets. If the device still receives no response packets from the RADIUS server after maximum retransmission attempts, authentication fails, and the device will consider the RADIUS server is invalid.

Secret Key

Configuration range: 0~63 characters

Function: Set the key to improve the communication security between client and RADIUS server. The two parties share the key to verify the legitimacy of packets. Both parties can receive packets from each other only when the keys are the same. Therefore, make sure the configured key is the same as the key on the RADIUS server.

Note:

The priority of “Timeout Peroid”, “Retransmission Times”, and “Secret Key” in RADIUS server configuration is higher than those in global configuration.

2. RADIUS Global Configuration, as shown below.

Figure 72 global configuration

RADIUS Enable

Configuration options: Enable/Disable

Default configuration: Disable

Function: Whether enable local RADIUS to be used by other devices as RADIUS servers.

3. Client RADIUS Configuration, as shown below.

Figure 73 Client RADIUS configuration

NAS-IP

Function: Configure IP address or IP address segment of RADIUS client.

Mask

Configuration range: 1-32

Function: Configure network segment of RADIUS client, the IP address of the same network segment only configure one segment.

Secret key

Configuration range: 1~63 characters

Function: Configure the shared key the device and the radius client to verify the validity of the message. Only if the key is the same, then accept and respond the message each other, so the shared key configured on the device must be same with the key value on the RADIUS client.

4. Host RADIUS Configuration, as shown below.

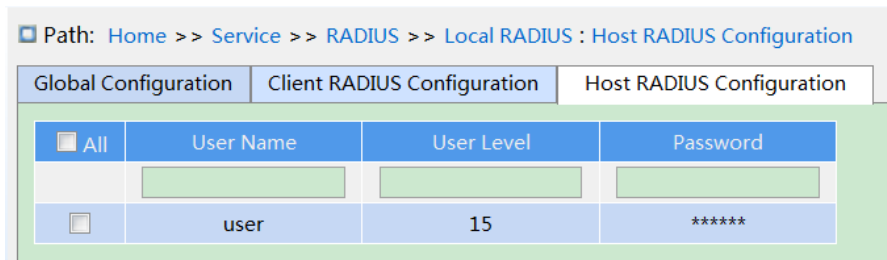

Figure 74 Host RADIUS configuration

User Name

Configuration range: 1-31 characters

Function: Configure RADIUS user name.

User Level

Configuration range:1~15

Function: Configure the user authority level. Users with different authority levels have different access authority.

Password

Configuration range: 1-31 characters

Function: Configure the login password of user.

5.6.3 Typical Configuration Example

As shown in Figure 75, IEEE802.1X is enabled on port 1 of the switch. Then users can log in to the switch through port 1 after passing the authentication on the RADIUS server. The IP address of the server is 192.168.0.23. The key for packet exchange between the switch and the server is aaa.

Figure 75 RADIUS Authentication Example

1. Set the IP address of the authentication server to 192.168.0.23 and password to aaa, as shown in Figure 71.
2. IEEE802.1x settings: enable IEEE802.1X globally. Set authentication type to radius, admin state of port 1 to port-based 802.1X, keep default settings for the other parameters.
3. Set both the user name and password on the RADIUS Server to ccc, encrypt key to aaa.
4. Install and run 802.1x client software on a PC. Enter ccc for the user name and password. Then the user can pass the authentication and access the switch through port 1.

5.7 DNS

5.7.1 Introduction

DNS (Domain Name System) is a distributed database for TCP/IP applications that provides conversion between domain names and IP addresses. Through the domain name system, the user can use the domain name which is easy to remember and meaningful, and the domain name can be converted to the correct IP address by the DNS server in the network.

Domain name resolution is divided into static domain name resolution and dynamic domain name resolution. In the process of domain name resolution, first use static domain name resolution (search the static domain name resolution table), if the static domain name resolution is not successful, then use dynamic domain name resolution.

Static domain name resolution is to manually establish the corresponding relationship

between domain name and IP address. When the user uses the domain name for some applications (such as telnet application), the system searches the static domain name resolution table and obtains the IP address for the specified domain name.

5.7.2 Web Configuration

1. Enable DNS proxy, configure domain name.

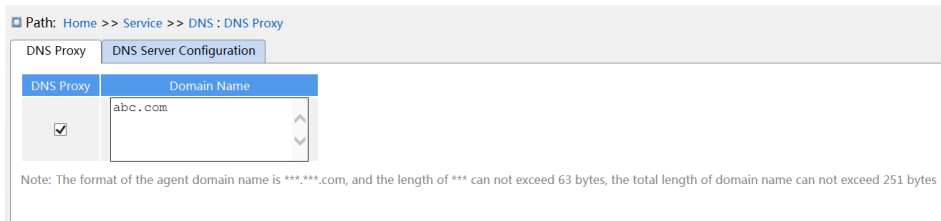

Figure 76 Configure DNS

DNS Proxy

Configuration options: Disable/enable

Default configuration: Disable

Function: Disable or enable DNS proxy.

Domain Name

Configuration range: The format of domain is *****.***.com**, and the length of ******* is less than 63 characters, the total length is less than 251 characters.

Default configuration: None

Function: After the client request the domain name to server directly and resolve the address failure, add the domain name suffix resolves to the DNS server again.

2. DNS Server Configuration

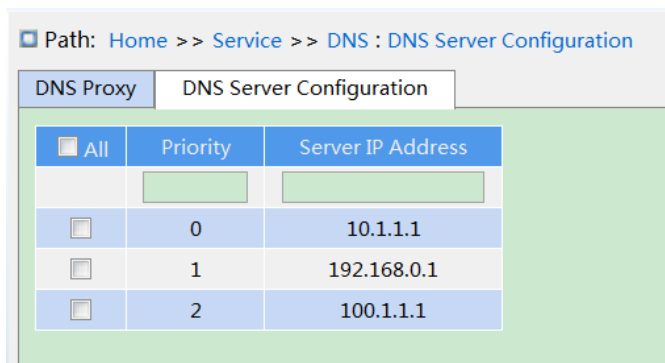

Figure 77 Configure the DNS server

Priority

Configuration range: 0, 1, 2

Default configuration: None

Function: the proxy device resolves the address to the specified DNS server in priority order until the resolution is successful.

Server IP Address

Configuration format: A.B.C.D

Function: Manually configure the DNS server IP address.

5.7.3 Typical Configuration Example

As shown in Figure 75, sometimes the DNS client can not or must not be directly configured as the DNS server address. At this time, the DNS address of the client can be set directly to the DNS proxy address by setting the dns proxy on the switch. After configuring the domain name suffix list, the DNS proxy will automatically add the configured suffix to the domain name when sending the DNS resolution request again after a request fails.

Figure 78 DNS proxy configuration example

1. Configure DNS Server IP address as 192.168.0.254/24.
2. Configure PC IP address as 192.168.1.2/24, DNS Server as 192.168.1.1;
3. Configure Switch0 interface Fa1/1 as access mode to join VLAN 1, configure L3 interface

IP as 192.168.1.1/24, interface Fa1/2 as access mode to join VLAN 2, configure L3 interface IP as 192.168.0.1/24;

4. Enable DNS proxy in Switch0, configure DNS Server IP as 192.168.0.254, configure domain suffix as abc.com, Thus the switch proxy DNS server can be implemented for DNS domain name resolution.

5.8 RMON

5.8.1 Introduce

Based on SNMP architecture, Remote Network Monitoring (RMON) allows network management devices to proactively monitor and manage the managed devices. An RMON network usually involves the Network Management Station and Agents. The NMS manages Agents and Agents can collect statistics on various types of traffic on these ports.

RMON mainly provides statistics and alarm functions. With the statistics function, Agents can periodically collect statistics on various types of traffic on these ports, such as the number of packets received from a certain network segment during a certain period. Alarm function is that Agents can monitor the values of specified MIB variables. When a value reaches the alarm threshold (such as the number of packets reaches the specified value), Agent can automatically record alarm events in RMON log, or send a Trap message to the management device.

5.8.2 RMON Groups

RMON (RFC2819) defines multiple RMON groups. The series devices support statistics group, history group, event group, and alarm group in public MIB.

➤ Statistics group

With the statistics group, the system collects statistics on all types of traffic on ports and stores the statistics in the Ethernet statistics table for further query by the management device. The statistics includes the number of network collisions, CRC error packets, undersized or oversized packets, broadcast and multicast packets, received bytes, and received packets. After creating a statistics entry on a specified port successfully, the

statistics group counts the number of packets on the port and the statistics is a continuously accumulated value.

➤ History group

History group requires the system to periodically sample all kinds of traffic on ports and saves the sampling values in the history record table for further query by the management device. The history group counts the statistics values of all kinds of data in the sampling interval.

➤ Event group

Event group is used to define event indexes and event handling methods. Events defined in the event group is used in the configuration item of alarm group. An event is triggered when the monitored device meets the alarm condition. Events are addressed in the following ways:

Log: logs the event and related information in the event log table.

Trap: sends a Trap message to the NMS and inform the NMS of the event.

Log-Trap: logs the event and sends a Trap message to the NMS.

None: indicates no action.

➤ Alarm group

RMON alarm management can monitor the specified alarm variables. After alarm entries are defined, the system will acquire the values of monitored alarm variables in the defined period. When the value of an alarm variable is larger than or equal to the upper limit, a rising alarm event is triggered. When the value of an alarm variable is smaller than or equal to the lower limit, a falling alarm event is triggered. Alarms will be handled according to the event definition.

Caution:

If a sampled value of alarm variable exceeds the threshold multiple times in a same direction, then the alarm event is only triggered only the first time. Therefore the rising alarm and falling alarm are generated alternately.

5.8.3 Web Configuration

1. Configure statistics table, as shown below.

All	ID	Data Source
<input type="checkbox"/>	1	.1.3.6.1.2.1.2.2.1.1.1000016

Figure 79 Configure RMON Statistics Table

ID

Configuration range: 1~65535

Function: Configure the number of the statistics entry. Statistics group supports up to 128 entries.

Data Source

Configuration range: 10000portid

Function: Select the port whose statistics are to be collected.

2. View statistics group status, as shown below.

ID	Data Source	Drop	Octets	Pkts	Broadcast	Multicast	CRC Errors	Undersize	Oversize	Frag.	Jabb.	Coll.	64Bytes	65-127	128-255	256-511	512-1023	1024-1518
1	1000016	1122201	2325178457	308292901	1386693	12116	0	0	0	0	0	0	1597619	13300323	26998244	53996460	107992975	104407280

Figure 80 Overview statistics group status

Drop: the number of packets dropped by the port.

Octets: the number of bytes received by the port.

Pkts: the number of packets received by the port.

Broadcast: the number of broadcast packets received by the port.

Multicast: the number of multicast packets received by the port.

CRC Errors: the number of CRC error packets with a length of between 64 and 9600 bytes received by the port.

Undersize: the number of packets with less than 64 bytes received by the port.

Oversize: the number of packets with more than 9600 bytes received by the port.

Frag.: the number of CRC error packets with less than 64 bytes received by the port.

Jabb.: the number of CRC error packets with more than 9600 bytes received by the port.

Coll.: the number of collisions received by the port under half duplex mode.

64 Bytes: the number of packets with a length of 64 bytes received by the port.

65~127: the number of packets with a length of between 65 and 127 bytes received by the

port.

128~255: the number of packets with a length of between 128 and 255 bytes received by the port.

256~511: the number of packets with a length of between 256 and 511 bytes received by the port.

512~1023: the number of packets with a length of between 512 and 1023 bytes received by the port.

1024~1588: the number of packets with a length of between 1024 and 1588 bytes received by the port.

Note:

The oversize depends on the parameter "Maximum Frame Size" in Port Configuration, as shown in 7.1 Port Configuration. In above example, the oversize is 9600 bytes.

3. Configure history table, as shown below.

Path: Home >> Service >> RMON : History Configuration

Statistics Configuration	Statistics Status	History Configuration	History Status	Alarm Configuration	Event Configuration	Event Status
<input type="checkbox"/>	All	ID	Data Source	Interval	Buckets	
<input type="checkbox"/>		1	.1.3.6.1.2.1.2.2.1.1.1000016	60	10	

Figure 81 Configure History Table

ID

Configuration range: 1~65535

Function: Configure the number of the history entry. History group supports up to 256 entries.

Data Source

Configuration options: 100000portid

Function: Select the port whose information is to be sampled.

Interval

Configuration range: 1~3600s

Default configuration: 1800s

Function: Configure the sampling period of the port.

Buckets

Configuration range: 1~65535

Default configuration: 50

Function: Configures the number of latest sampling values of port information stored in RMON.

4. View history group status, as shown below.

Figure 82 Overview History Group Status

5. Configure event table, as shown below.

Figure 83 Configure Event Table

ID

Configuration range: 1~65535

Function: Configure the index number of the event entry. Event group supports up to 128 entries.

Description

Configuration range: 0~127 characters

Function: Describe the event.

Type

Configuration options: none/log/snmpttrap/logandtrap

Default configuration: none

Function: Configure the event type for alarms, that is, the processing mode towards alarms.

Event Last Time

Function: Displays the value of sysUpTime when the event is used last time.

6. View event group status, as shown below.

Figure 84 Overview Event Group Status

7. Configure alarm table, as shown below.

Figure 85 Configure Alarm Table

ID

Configuration range: 1~65535

Function: Configure the number of the alarm entry. Alarm group supports up to 256 entries.

Interval

Configuration range: 1~2147483647s

Configuration Default: 30s

Function: Configure the sampling period.

Variable

Configuration Format: A.10000portid

Configuration range: A: 10~21

Function: Select the port MIB information to be monitored.

InOctets: A=10, the number of bytes received by the port.

InUcastPkts: A=11, the number of unicast packets received by the port.

InNUcastPkts: A=12, the number of broadcast and multicast packets received by the port.

InDiscards: A=13, the number of packets dropped by the port.

InErrors: A=14, the number of error packets received by the port.

InUnknownProtos: A=15, the number of unknown packets received by the port.

OutOctets: A=16, the number of bytes sent by the port.

OutUcastPkts: A=17, the number of unicast packets sent by the port.

OutNUcastPkts: A=18, the number of broadcast and multicast packets sent by the port.

OutDiscards: A=19, the number of discarded packets sent by the port.

OutErrors: A=20, the number of error packets sent by the port.

OutQLen: A=21, The length of packets in port outlet queue.

Sample Type

Configuration options: Absolute/Delta

Default configuration: Delta

Function: choose the method of comparing the sampling value and threshold.

Description: Absolute: directly compare each sampling value to threshold; Delta: the sampling value minus the previous sampling value, then use the difference to compare with threshold.

Startup Alarm

Configuration options: Rising/Falling/RisingOrFalling

Default configuration: RisingOrFalling

Function: choose the alarm type.

Rising Threshold

Configuration range: 1~2147483647

Function: Set a rising threshold. When the sampling value exceeds the rising threshold and the alarm type is RisingAlarm or RisOrFallAlarm, the alarm will be triggered and the rising event index will be activated.

Rising Index

Configuration range: 1~65535

Function: Set the index of a rising event. It is the handling method of a rising alarm.

Falling Threshold

Configuration range: 1~2147483647

Function: Set a falling threshold. When the sampling value is lower than the falling threshold and the alarm type is FallingAlarm or RisOrFallAlarm, the alarm will be triggered and the

falling event index will be activated.

Falling Index

Configuration range: 1~65535

Function: Set the index of a falling event. It is the handling method of a falling alarm.

6 Alarm

6.1 Introduction

This series switches support the following types of alarms:

- Power alarm: If the function is enabled, then an alarm will be generated for a single power input.
- IP/MAC conflict alarm: If the function is enabled, then an alarm will be triggered for an IP/MAC conflict.
- Memory / CPU usage alarm: If this function is enabled, an alarm is generated when the CPU / memory usage exceeds the specified threshold.
- Port alarm: If this function is enabled, an alarm is triggered when the port is in link down state.
- Port traffic alarm: If this function is enabled, an alarm is generated when the incoming / outgoing traffic rate of a port exceeds the specified threshold.
- CRC error / packet loss alarm: If this function is enabled, an alarm is generated when the number of CRC error / packet loss of a port exceeds the specified threshold.
- Ring alarm: If this function is enabled, an alarm is triggered when the ring is open.

6.2 Web Configuration

1. Basic alarm configuration and display, as shown below.

Alarm Type	Enable	Status	Threshold	Margin Value	Detection Time
Power Alarm	<input type="checkbox"/>	Disable	--	--	--
IP/MAC Conflict Alarm	<input checked="" type="checkbox"/>	IP MAC Conflict	--	--	300 (180~600s)
CPU Availability Alarm	<input checked="" type="checkbox"/>	Normal	85%	5%	--
Memory Availability Alarm	<input checked="" type="checkbox"/>	Normal	85%	5%	--

Figure 86 Basic Alarm

Power Alarm

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable/Disable Power Alarm.

Status

Configuration options: Normal/Alarm

Function: View power alarm status.

Alarm: For redundant power products, one of the power modules fails or works abnormally and an alarm is triggered.

Normal: For single power products, the power module supplies power normally; for redundant power product, two power modules both supply power normally.

IP, MAC Conflict

Configuration options: Enable/Disable

Default configuration: Enable

Function: Enable/Disable IP/MAC conflict alarm.

Status

Configuration options: Conflict / No Conflict

Description: When an IP/MAC conflict occurs, Conflict is displayed; otherwise, No Conflict is displayed.

Check Time

Configuration range: 180~600s

Default configuration: 300s

Function: Configure the interval for detecting IP/MAC conflicts.

CPU/Memory Availability Alarm

Configuration options: Enable/Disable

Default configuration: Enable

Function: Enable/Disable CPU/Memory Availability Alarm.

Threshold (%)

Configuration range: 50~100

Default configuration: 85

Function: Set the CPU/memory usage threshold. When the CPU/memory usage of the switch is higher than the threshold, an alarm is generated.

Margin Value (%)

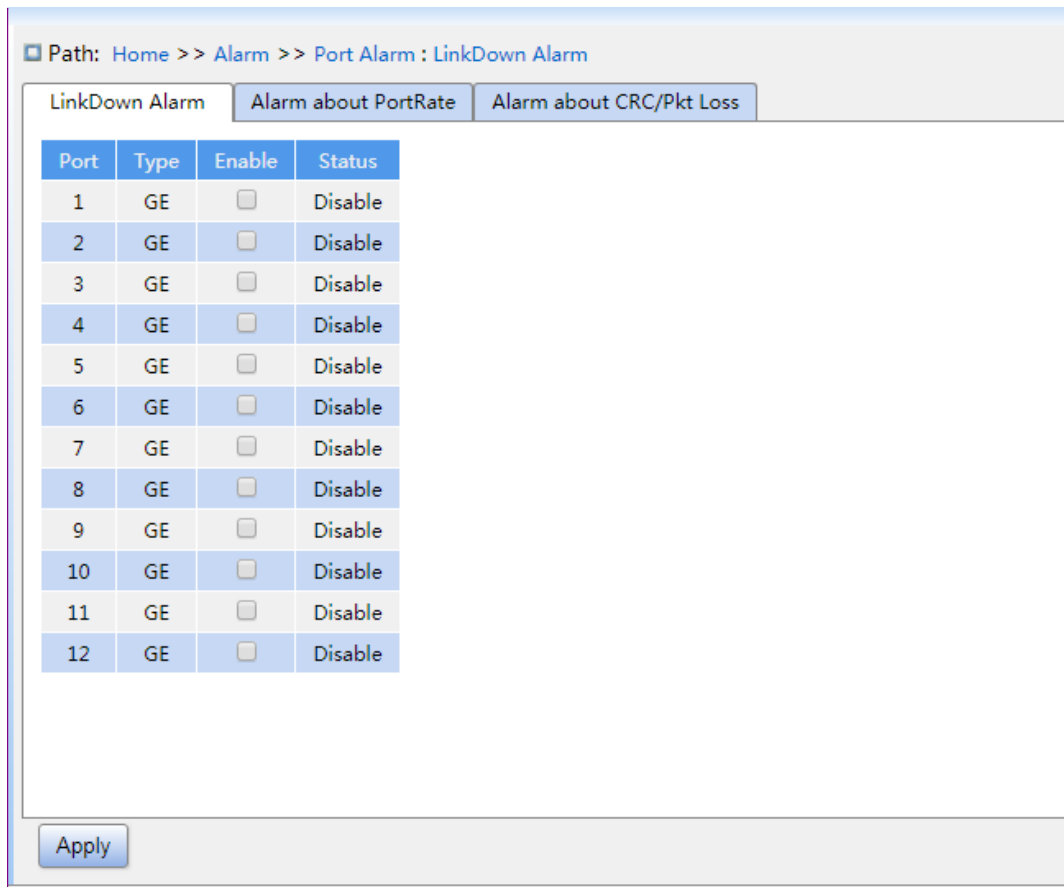

Configuration range: 1~20

Default configuration: 5

Function: Set the CPU/memory usage margin value.

Description: If the CPU/memory usage fluctuates around the threshold, alarms may be generated and cleared repeatedly. To prevent this phenomenon, you can specify a margin value (5% by default). The alarm will be cleared only if the CPU/memory usage is lower than the threshold by the margin value or more. For example, the memory usage threshold is set to 60% and the margin value is set to 5%. If the memory usage of the switch is lower than or equal to 60%, no alarm is generated. If the memory usage is higher than 60%, an alarm will be generated. The alarm will be cleared only if the memory usage is equal to or lower than 55%.

2. Configure and display port alarm, as shown below.

批注 [k2]: 更新图纸

Figure 87 Port Alarm

Port Alarm Configuration

Configuration options: Disable/Enable

Default configuration: Disable

Function: Enable/Disable port alarm.

Status

Configuration options: Link Up/Link Down

Description: Link Up means the port is in connection state and supports normal communication. Link Down means the port is disconnected or in abnormal connection (communication failure).

3. Configure and display port traffic alarm, as shown below.

批注 [k3]: 更新图纸

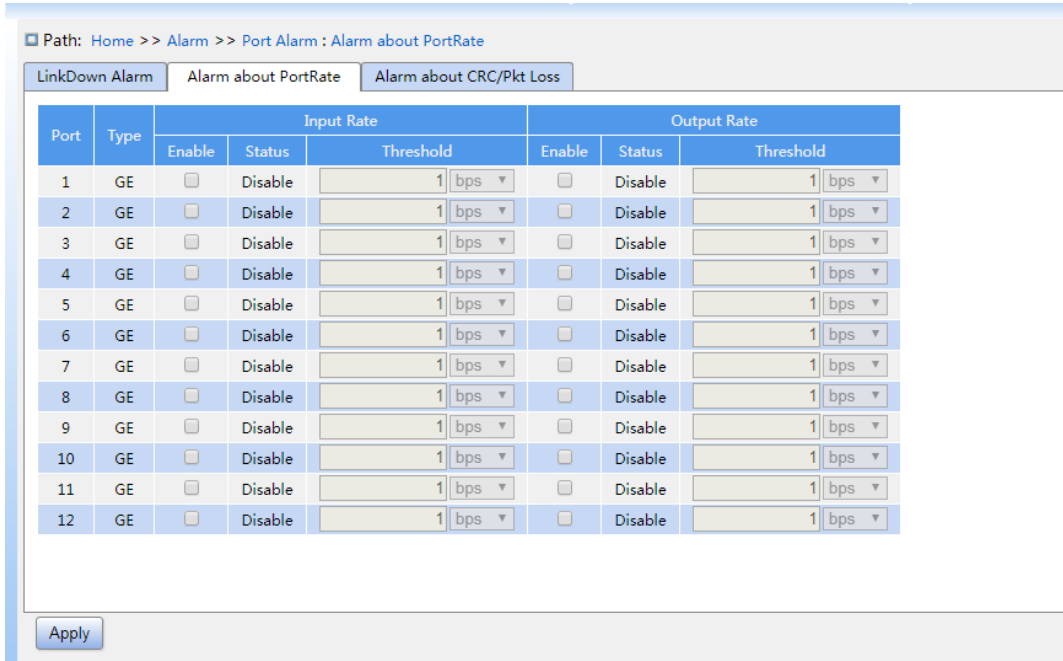

Figure 88 Port Traffic Alarm Configuration

input rate alarm/output rate alarm

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable/Disable port traffic alarm.

Threshold

Configuration range: 1 to 1000000000bps or 1 to 1000000kbps.

Function: Configure the threshold for the port traffic.

Alarm Status

Configuration options: Disable/Alarm/ Normal

Function: View the port traffic status. Alarm means the incoming / outgoing traffic rate exceeds the threshold and triggers alarm.

4. Configure and display CRC error / packet loss alarm, as shown below.

批注 [k4]: 更新图纸

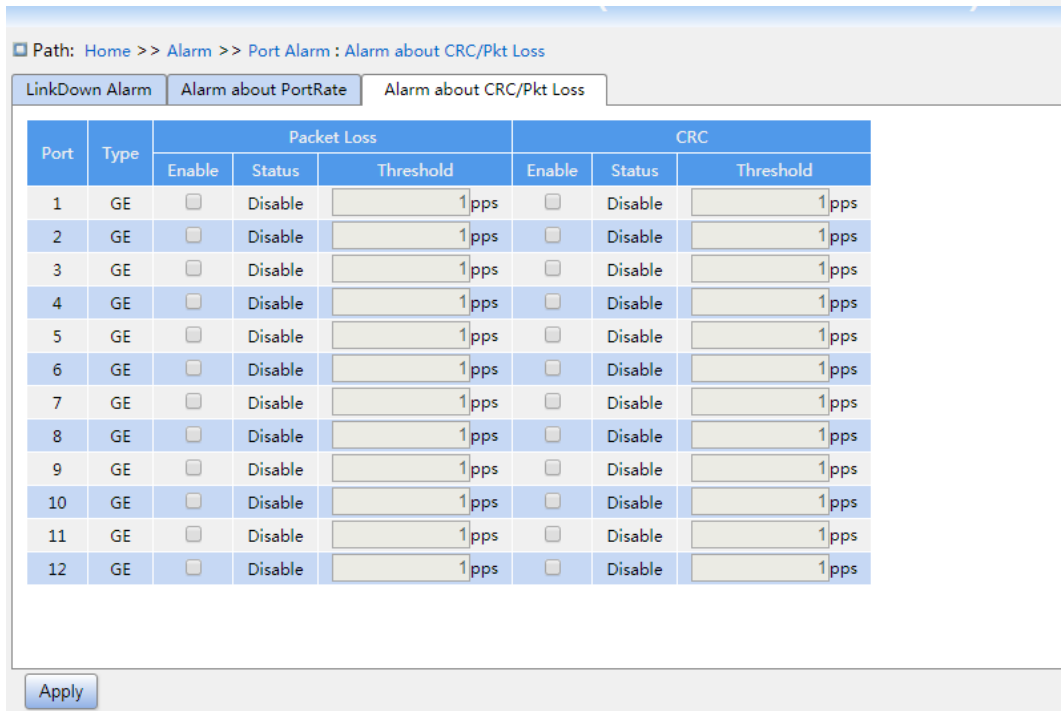

Figure 89 CRC Error/ Pkt Loss Alarm Configuration

CRC/Pkt Loss Alarm

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable/Disable CRC/ Pkt loss alarm.

Threshold

Configuration range: 1 to 1000000pps.

Function: Configure the threshold for the port CRC/ Pkt loss alarm.

Alarm Status

Configuration options: Disable/Alarm/ Normal

Function: View the port CRC/ Pkt loss status. Alarm means the port CRC/ Pkt loss exceeds the threshold and triggers alarm.

6. Configure and display Ring alarm, as shown below.

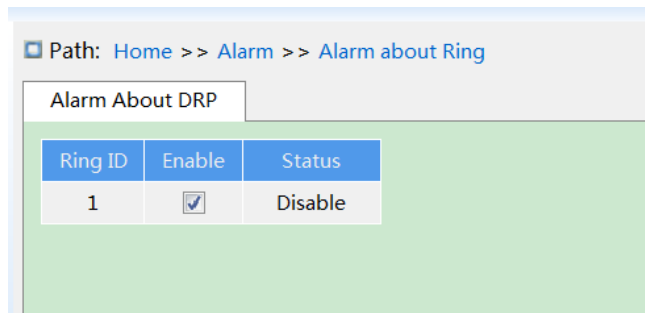

Figure 90 Ring Alarm Configuration

Alarm About DRP

Configuration options: Disable/Enable

Default configuration: Disable

Function: Enable/Disable DRP alarm.

Alarm Status

Configuration options: Disable/Alarm/---

Function: View the DRP status. --- means DRP is closed. Alarm means DRP is open or in abnormal state.

7 Function Management

7.1 Port Configuration

1. Configure port status, port rate, flow control etc. information, as shown below.

Path: Home >> Function Management >> Port Configuration : Port Mode

Port	Type	Admin State	Link Status	Auto Negotiate	Speed	Full	Flow Control	Maximum Frame Size
1	GE	<input checked="" type="checkbox"/>	Down	<input checked="" type="checkbox"/>	<input type="radio"/> 10M <input type="radio"/> 100M <input checked="" type="radio"/> 1000M	<input checked="" type="checkbox"/>	<input type="checkbox"/>	10240

Apply

Figure 91 Configure port mode

Administration Status

Configuration options: Enable/disable

Default configuration: Enable

Function: Whether the port is allowed to transfer data.

Description: Open port to transfer data if enable, close port and no data is transferred if disable. This option directly affects the hardware status of the port and triggers port alarm information.

Link Status

Displays the connection status of the current port.

Up means port is LinkUp status and communication is normal.

Down means port is LinkDown status and communication is abnormal.

Auto Negotiate

Configuration options: Enable/disable

Default configuration: Enable

Description: Configure port rate and duplex mode. Port rate and duplex mode can be auto negotiation or can be forced. Port rate and duplex mode automatically negotiated according to the connection status of both ports when configured to automatic negotiation mode. It is recommended that the user configure the speed and duplex mode of the port to automatic negotiation so to avoid connection problems caused by the mismatch of the port configuration as far as possible. If the user configures the port to forced rate / duplex mode, make sure the both ends connection rate / duplex mode configuration are same.

Caution:

- The 100M electric port can be configured as auto negotiation, 10M full duplex, 10M half-duplex, 100M full duplex, 100M half-duplex.
- The Gigabit electric port can be configured as auto negotiation, 10M full duplex, 10M half-duplex, 10M full duplex, 100M and 1000M full duplex.

Speed

Configuration options: 10M/100M or 10M/100M/1000M

Function: Configure auto negotiation speed of port.

Description: When configuring port mode to automatic negotiation, the speed of port is determined through auto negotiation with the opposite end by default. The negotiated speed can be any of the port speed range. By configuring speed, the port can negotiate only part rate, thus controlling rate negotiation.

Caution:

Duplex capability and rate capability configuration can only be configured when auto-negotiation mode is off

Full

Configuration options: Enable/disable

Function: Configure port auto negotiation duplex mode.

Description: full duplex means that the port can receive data while sending data; half duplex port can only send or receive data at any one time. When the port mode is configured to automatic negotiation, the port duplex mode is determined by negotiation with the end-to-end by default. The negotiated duplex mode can be either full duplex or half-duplex. By configuring the duplex, the port can negotiate only one duplex mode, thus controlling the duplex mode negotiation.

Flow Control

Configuration options: Enable/disable

Default configuration: Disable

Function: Enable or disable flow control.

Description: after enable port flow control, when the port receives more traffic than the maximum value the port cache can hold, the port will inform the sending end to slow down the sending speed to prevent packet loss according to the algorithm or protocol. For half duplex mode and full duplex mode, flow control is implemented in different ways. In full duplex mode, the receiving end informs the sending end to stop sending the message by sending a special data frame (pause frame), after receiving the pause frame, the sending end will stop sending the message according to the waiting time in the frame. The half-duplex mode supports backpressure flow control, and the receiving end can intentionally create a collision or carrier signal, once the sending end detects the collision or carrier signal then adopts Backoff to delay the data transmission.

Maximum Frame Size

Configuration options: 1518~10240 bytes

Default configuration: 10240 bytes

Function: configure the allowed maximum frame size of the port, and the frame above that size will be discarded.

2、 Port Rate, as shown below.

Path: Home >> Function Management >> Port Configuration : Port Rate

Port Mode | Port Rate | Port Storm Suppression | Port Isolate | Port Statistics | Port Name Map

Port	Type	Receiving Rate

Note: 0 means no limit.

Apply

Figure 92 Port Rate

Receiving Rate

Configure options: 10~13128147kbps/10~13128147fps/1~13128kfps/1~13128mbps

Default configuration: 0, value is 0 means disable limit rate.

Function: configure port rate limit threshold. Message data above the threshold will be discarded.

3. Port Storm Suppression configuration, as shown below.

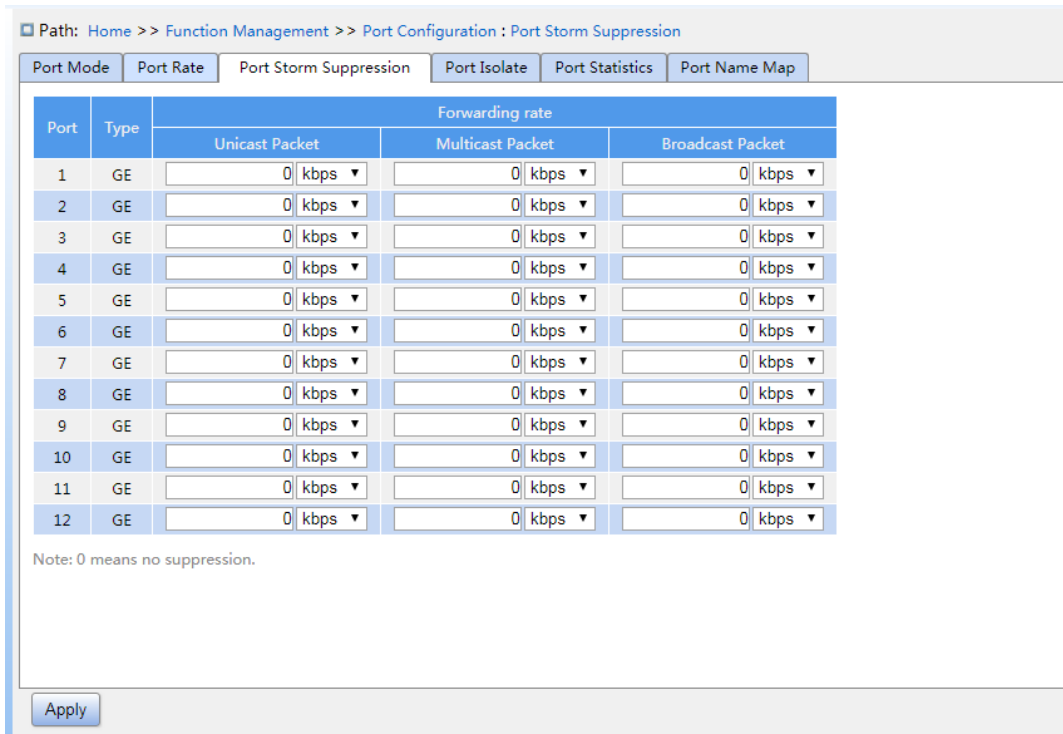

Figure 93 Port Storm Suppression

Forwarding Rate

Configuration options: Unicast Packet/Multicast Packet/Broadcast Packet

Configuration range: 10~13128147kbps/10~13128147fps/1~13128kfps/1~13128mbps

Default configuration: 0 (disable storm suppression).

Function: configure port forwarding rate threshold, this type of packet data above the threshold will be discarded.

4、Port Isolate configuration, as shown below.

Figure 94 Port Isolate

Enable Port Isolate

Configuration options: Enable/disable

Default configuration: Disable

Function: Enable or disable port isolate.

Note: there is only one port isolation group.

5. Port Statistics, as shown below.

7.2 VLAN

7.2.1 VLAN Configuration

7.2.1.1 Introduction

One LAN can be divided into multiple logical Virtual Local Area Networks (VLANs). A device can only communicate with the devices on the same VLAN. As a result, broadcast packets are restricted to a VLAN, optimizing LAN security.

VLAN partition is not restricted by physical location. Each VLAN is regarded as a logical network. If a host in one VLAN needs to send data packets to a host in another VLAN, a router or layer-3 device must be involved.

7.2.1.2 Principle

To enable network devices to distinguish packets from different VLANs, fields for identifying VLANs need to be added to packets. At present, the most commonly used protocol for VLAN identification is IEEE802.1Q. Table 2 shows the structure of an 802.1Q frame.

Table 2 802.1Q Frame Structure

DA	SA	802.1Q header				Length/type	Data	FCS
		TPID	PRI	CFI	VID			

A 4-byte 802.1Q header, as the VLAN tag, is added to the traditional Ethernet data frame.

TPID: 16 bits. It is used to identify a data frame carrying a VLAN tag. The value is 0x8100. The value of TPID specified in the 802.1Q protocol is 0x8100.

PRI: three bits, identifying the 802.1p priority of a packet.

CFI: 1 bit, specifies whether an MAC address is encapsulated in the standard format in different transmission media. The value 0 indicates that an MAC address is encapsulated in the standard format and the value 1 indicates that an MAC address is encapsulated in non-standard format.

VID: 12 bits, indicating the VLAN number. The value ranges from 1 to 4093. 0, 4094, and 4095 are reserved values.

**Note:**

- VLAN 1 is the default VLAN and cannot be manually created and deleted.
- Reserved VLANs are reserved to realize specific functions by the system and cannot be manually created and deleted.

The packet containing 802.1Q header is a tagged packet; the one without 802.1Q header is an untagged packet. All packets carry an 802.1Q tag in the switch.

7.2.1.3 Port-based VLAN

VLAN partition can be either port-based or MAC address-based. This series switches support port-based VLAN partition. VLAN members can be defined based on switch ports. After a port is added to a specified VLAN, the port can forward the packets with the tag for the VLAN.

1. Port Mode

Ports fall into two types according to how they handle VLAN tags when they forward packets.

Access: In access mode, the port can be added to only one VLAN. By default, all switch ports are access ports and belong to VLAN1. Packets forwarded by an access port do not have VLAN tags. Access ports are usually used to connect to terminals that do not support 802.1Q.

Trunk: In trunk mode, the port can be added to many VLAN. When sending PVID packets, the Trunk port can be set whether to carry the tag. It carries the tag when sending other packets. Trunk ports are usually used to connect network transmission devices.

Hybrid: In hybrid mode, the port can be added to many VLAN. You can set the type of packets to be received by a Hybrid port and whether the tag is carried when the Hybrid port sends packets. The Hybrid port can be used to connect network devices and user devices. The difference between a Hybrid port and a Trunk port is as follows: The Hybrid port does not carry the tag when sending packets from multiple VLANs and the Trunk port does not carry the tag only when sending PVID packets.

2. PVID

Each port has a PVID. When receiving an untagged packet, a port adds a tag to the packet

according to the PVID. The default PVID of all ports is 1.

Caution:

- When configuring the PVID of a port, select one of the VLAN IDs allowed through the port; otherwise, the port may fail to forward packets.
- When the PVID tag is added to untagged packets, you can refer to PCP and DEI settings in Figure 204 for the default PRI and CFI values of a port.

Table 3 shows how the switch processes received and forwarded packets according to the port mode, and PVID.

Table 3 Different Processing Modes for Packets

Processing Received Packets		Processing Packets to Be Forwarded	
Untagged packets	Tagged packets	Port Mode	Packet Processing
Add PVID tags to packets: ➤ If the PVID is in the list of VLANs allowed through, accept the packet. ➤ If the PVID is not in the list of VLANs allowed through, discard the packet.	➤ If the VLAN ID in a packet is in the list of VLANs allowed through, accept the packet. ➤ If the VLAN ID in a packet is not in the list of VLANs allowed through, discard the packet.	Access	Forward the packet after removing the tag.
		Trunk	Forward the packet according to the “Egress Tagging” configuration: ➤ Untag Port VLAN: If the VLAN ID in a packet is the same as PVID, and in the list of VLANs allowed through, forward the packet after removing the tag. If the VLAN ID in a packet is different from PVID, and in the list of VLANs allowed through, keep the tag and forward the packet. ➤ Tag All: If the VLAN ID in a packet is in the list of VLANs allowed through, keep the tag and forward the packet.

		Hybrid	<p>Forward the packet according to the “Egress Tagging” configuration:</p> <ul style="list-style-type: none"> ➤ Untag Port VLAN: the same as above. ➤ Tag All: the same as above. ➤ Untag All: If the VLAN ID in a packet is in the list of VLANs allowed through, forward the packet after removing the tag.

Port	PVID
1	2
2	2
3	100
4	100
5	200
6	200

Figure 100 Configure Access Port

PVID

Configuration range: 1-4094

Default configuration: 1

Function: configure the default VLAN for the Access port.

Caution:

➤ The VLAN need to be created before configuring VLAN ID of Access port, the Trunk, Hybrid

port are similar.

4. Trunk Port Configuration, as shown below.

Figure 101 Trunk Port Configuration

PVID

Configuration range: 1-4094

Default configuration: 1

Function: Configure default VLAN of Trunk port.

Allowed VLAN

Configuration range: 1-4094, separated by half-angle comma ',' and a hyphen '-' (M-N, M must be less than N) , for example: 2, 33, 34-77.

Default configuration: 1

Function: Configure allowed VLAN of Trunk port.

5. Hybrid Port Configuration, as shown below.

Figure 102 Hybrid Port Configuration

PVID

Configuration range: 1-4094

Default configuration: 1

Function: Configure default VLAN of Hybrid port.

Allowed Untag VLAN

Configuration range: 1-4094, separated by half-angle comma ',' and a hyphen '-' (M-N, M must be less than N) , for example: 2,33,34-77.

Default configuration: 1

Function: Configure allowed Untag VLAN of Hybrid port.

Allowed Tag VLAN

Configuration range: 1-4094, separated by half-angle comma ',' and a hyphen '-' (M-N, M must be less than N) , for example: 2,33,34-77.

Default configuration: None

Function: Configure allowed Tag VLAN of Hybrid port.

7.2.1.5 Typical Configuration Example

As shown in Figure 103, the entire LAN is divided into 3 VLANs: VLAN2, VLAN100, and VLAN200. It is required that the devices in the same VLAN can communicate with each other, but different VLANs are isolated. The terminal PCs cannot distinguish tagged packets, so the ports connecting Switch A and Switch B with PCs are set to access port. VLAN2, VLAN100, and VLAN200 packets need to be transmitted between Switch A and Switch B, so the ports connecting Switch A and Switch B should be set to trunk port, permitting the packets of VLAN 2, VLAN 100, and VLAN 200 to pass through. Table 4 shows specific configuration.

Table 4 VLAN Configuration

VLAN	Configuration
VLAN2	Set port 1 and port 2 of Switch A and B to access ports, and port 7 to trunk port.
VLAN100	Set port 3 and port 4 of Switch A and B to access ports, and port 7 to trunk port.
VLAN200	Set port 5 and port 6 of Switch A and B to access ports, and port 7 to trunk port.

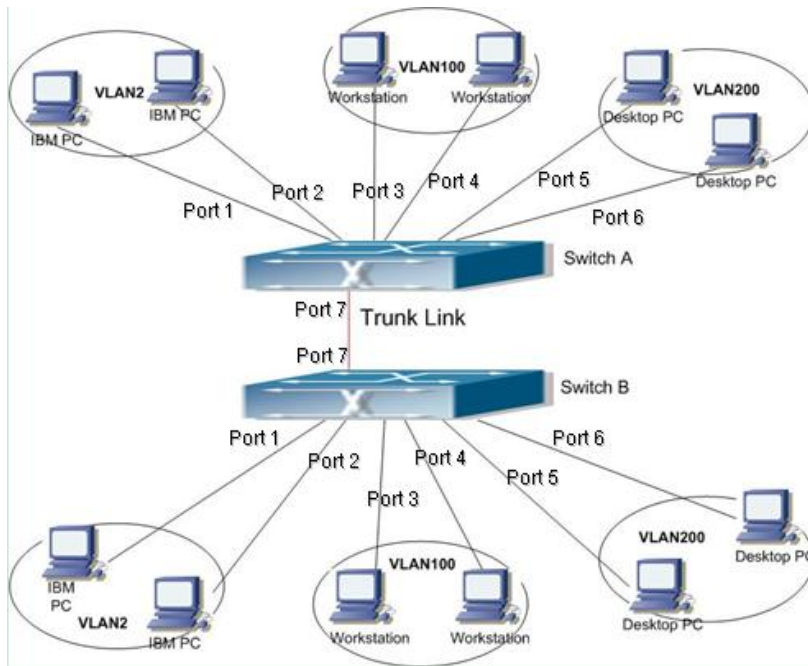

Figure 103 VLAN Application

Configurations on Switch A and Switch B:

1. Configure allowed access VLANs to 1,2,100,200, as shown in Figure 100.
2. Configure ports 1, 2 as access ports, port VLAN as 2. Configure ports 3, 4 as access ports, port VLAN as 100. Configure ports 5, 6 as access ports, port VLAN as 200. Configure port 7 as trunk port, port VLAN as 1, allowed VLANs as 1,2,100,200, as shown in Figure 101.
3. Keep all the other parameters default.

7.2.2 GVRP

7.2.2.1 GARP Introduction

The Generic Attribute Registration Protocol (GARP) is used for spreading, registering, and cancelling certain information (VLAN, multicast address) among switches on the same network.

With GARP, the configuration information of a GARP member will spread the information to the entire switching network. A GARP member instructs the other GARP members to register or cancel its own configuration information by means of join/leave message

respectively. The member also registers or cancels the configuration information of other members based on join/leave messages sent by other members.

GARP involves three types of messages: Join, Leave, and LeaveAll.

When a GARP application entity wants to register its own information on other switches, the entity sends a Join message. Join messages fall into two types: JoinEmpty and JoinIn. A JoinIn message is sent to declare a registered attribute, while a JoinEmpty message is sent to declare an attribute that is not registered yet.

When a GARP application entity wants to cancel its own information on other switches, the entity sends a Leave message.

After a GARP entity starts, it starts the LeaveAll timer. When the timer expires, the entity sends a LeaveAll message.

**Note:**

An application entity indicates a GARP-enabled port.

GARP timers include Hold timer, Join timer, Leave timer, LeaveAll timer.

Hold Timer: when a GARP-enabled switch receives a registration message, it starts a Hold timer rather than sending out the Join message immediately. When the Hold timer times out, it will put all registration information received during this time in a same Join message and send it out, reducing the message quantity for network stability.

Join Timer: in order to guarantee that the Join message can be reliably transmitted to other switches, the GARP-enabled switch will wait for a time interval of a Join timer after sending the first Join message. If the switch does not receive a Join In message during this time, it will send out a Join message again, otherwise, it won't send the second message.

Leave Timer: when a GARP-enabled switch wishes other switches to cancel its attribute information, it sends out a Leave message. Other GARP-enabled switches that receive this message will enable a Leave timer. If they do not receive a Join message until the timer times out, they will cancel this attribute information.

LeaveAll Timer: When a switch enables GARP, it starts a LeaveAll timer at the same time. When the timer times out, the switch will send a LeaveAll message to other GARP-Enabled

switches and let them re-register their all attribute information, and then restart the LeaveAll timer to begin a new cycle.

7.2.2.2 GVRP Introduction

GVRP (GARP VLAN Registration Protocol) is a GARP application and is based on the GARP working mechanism to maintain the VLAN dynamic registration information of the device and propagate the information to other devices.

The GVRP-enabled device can receive VLAN registration information from other devices and dynamically update the local VLAN registration information, and the device can propagate the local VLAN registration information to other devices, reaching the consistency of VLAN information in all devices in the same LAN. The VLAN registration information propagated by GVRP contains not only the manually configured local static registration information, but also the dynamic registration information from other devices.

Caution:

GVRP port and port channel are mutually exclusive. The port in a port channel cannot be configured as a GVRP port; the GVRP port cannot be added to a port channel.

7.2.2.3 Web Configuration

1. Global enable GVRP protocol, and configure timer, as shown below.

Path: Home >> Function Management >> VLAN >> GVRP : Global Configuration

Global Configuration | GVRP Port Configuration

GVRP Enable

Parameters	Value
Join-time	20 (Centisecond(s))
Leave-time	60 (Centisecond(s))
LeaveAll-time	1000 (Centisecond(s))
Max VLANs	20

Note:When GVRP is enabled, you can not modify GVRP related parameters. If you need to modify GVRP parameters, disable the GVRP first

Apply

Figure 104 GVRP Global Configuration

GVRP enable

Configuration options: Enable/disable

Default configuration: Disable

Function: Enable or disable GVRP.

Join timer

Configuration options: 1-20 (centisecond)

Default configuration: 20 (centisecond)

Function: Configure Join timer value.

Leave timer

Configuration options: 60-300 (centisecond)

Default configuration: 60 (centisecond)

Function: Configure Leave timer value.

LeaveAll timer

Configuration options: 1000-5000 (centisecond)

Default configuration: 1000 (centisecond)

Function: Configure leave all timer value.

Description: if the LeaveAll timer for different devices times out at the same time, multiple LeaveAll messages are sent simultaneously to increase the number of unnecessary messages, in order to avoid the LeaveAll timer timeout on different devices at the same time, The value of the actual Leave all timer is a random value which is greater than the leave all timer value, less than 1.5 times the leave all timer value.

Max VLANs

Configuration range: 1~4094

Default configuration: 20

Function: Configure the registered dynamically max VLANs of GVRP port.

Caution:

➤ Disable GVRP before configuring GVRP timer and Max VLANs.

2. GVRP Port Configuration, as shown below.

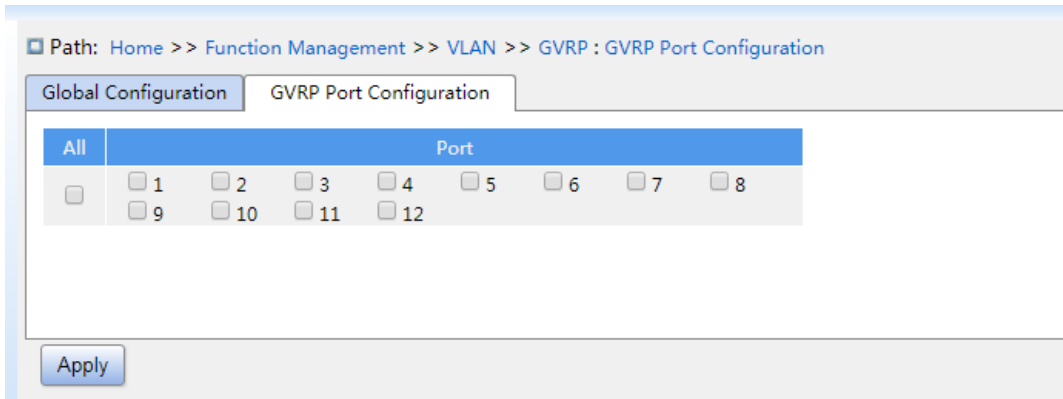

Figure 105 GVRP Port Configuration

Port

Configuration options: Enable/disable

Default configuration: Disable

Function: enable or disable GVRP of port.

Caution:

- The GVRP port should be configured as a trunk port;
- The GVRP port diffuses the VLAN property of other GVRP ports with the UP status.

7.2.2.4 Typical Configuration Example

As Figure 106 shows, GVRP needs to be enabled on devices so that VLAN information is dynamically registered and updated between device A and device B.

Figure 106 GVRP Configuration Example

Device A configuration are as follows:

1. Configure port 1 to trunk port, allowed VLANs to 1.
2. Enable global GVRP, as shown in Figure 104.
3. Enable GVRP on port 1, as shown in Figure 105.

Device B configuration are as follows:

1. Configure port 4 to trunk port, allowed VLANs to 1; configure port 5 to access port, allowed VLANs to 5; configure port 6 to trunk port, allowed VLANs to 1, 6.
2. Enable global GVRP, as shown in Figure 104.
3. Enable GVRP on port 4, 5, 6, as shown in Figure 105.

Port 1 of Switch A can register the same VLAN information as that of port 5 and 6 of Switch B.

7.2.3 PVLAN Configuration

7.2.3.1 Introduction

PVLAN (Private VLAN) uses two layers isolation technologies to realize the complex port traffic isolation function, achieving network security and broadcast domain isolation.

The upper VLAN is a shared domain VLAN in which ports are uplink ports. The lower VLANs are isolation domains in which ports are downlink ports. Downlink ports can be assigned to different isolation domains and they can communicate with uplink port at the same time. Isolation domains cannot communicate to each other.

Figure 107 PVLAN Application

As shown in Figure 107, the shared domain is VLAN100 and the isolation domains are VLAN 10 and VLAN 30; the devices in the isolation domains can communicate with the device in the share domain, such as VLAN 10 can communicate with VLAN 100; VLAN 30 can also communicate with VLAN 100, but the devices in different isolation domains cannot communicate with each other, such as VLAN 10 cannot communicate with VLAN 30.

7.2.3.2 Explanation

PVLAN function can be implemented through special configuration on ports.

- The PVID of uplink ports are the same as shares domain VLAN ID; the PVID of downlink ports are the same as their own isolation domain VLAN ID.
- The uplink ports are set to hybrid and are assigned to the shares domain VLAN and all isolation domains; the downlink ports are set to hybrid and are assigned to the shared domain VLAN and own isolation domain.
- The packets sent by PVLAN member ports are Untag.

7.2.3.3 Web Configuration

1. Uplink Port Configuration, as shown in below.

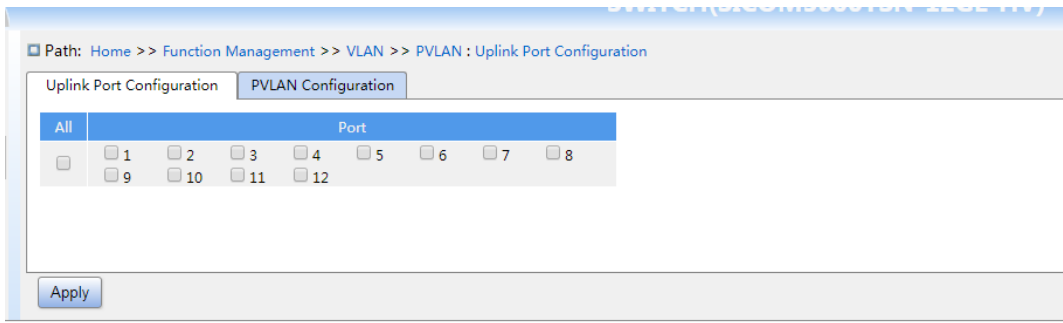

Figure 108 Configure Uplink Port

Port

Configuration options: Enable/disable

Default configuration: Disable

Function: configure port as uplink port

2. PVLAN Configuration, as shown below.

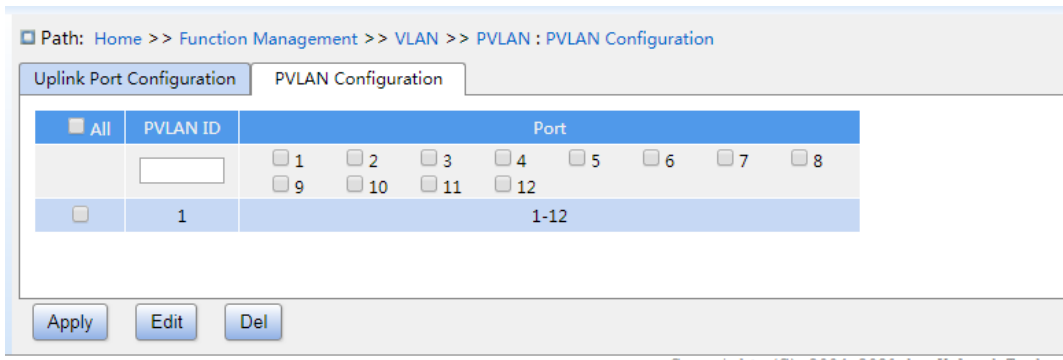

Figure 109 Configure PVLAN

PVLAN ID

Configuration options: 1-4094

Default configuration: 1

Function: configure the PVLAN ID of port.

Port

Configuration options: Enable/disable

Default configuration: 1-28

Function: specify PVLAN port.

7.2.3.4 Typical Configuration Example

Figure 110 shows PVLAN application. VLAN300 is a shared domain and port 1 and port 2 are uplink ports; VLAN100 and VLAN200 are isolation domains and ports 3, 4, 5, and 6 are downlink ports.

Figure 110 PVLAN Configuration Example

Switch configuration:

1. Configure ports 1, 2 to hybrid ports, port VLAN to 300, egress tagging to Untag All, allowed VLANs to 100,200,300.
2. Configure ports 3, 4 to hybrid ports, port VLAN to 100, egress tagging to Untag All, allowed VLANs to 100,300.
3. Configure ports 5, 6 to hybrid ports, port VLAN to 200, egress tagging to Untag All, allowed VLANs to 200,300.
4. Keep all the other parameters default.

7.2.4 VLAN STATUS

Check the port VLAN status, as shown below.

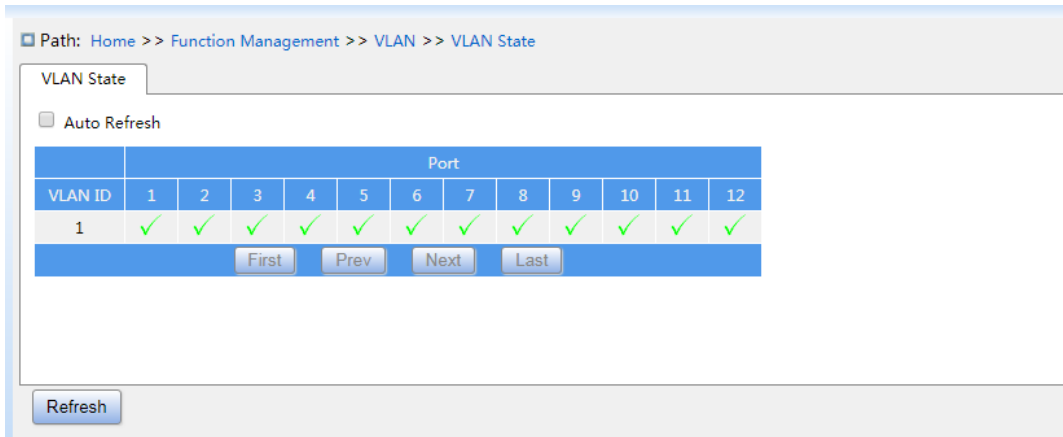

Figure 111 Port VLAN status

7.3 IP Configuration

7.3.1 IP Address Configuration

1. View the switch IP address through the Console port

Log in to the CLI of the switch through the console port. Run the command **show interface vlan 1** in the privileged user configuration mode to view the IP address of the switch, as shown in the red circle of Figure 112.

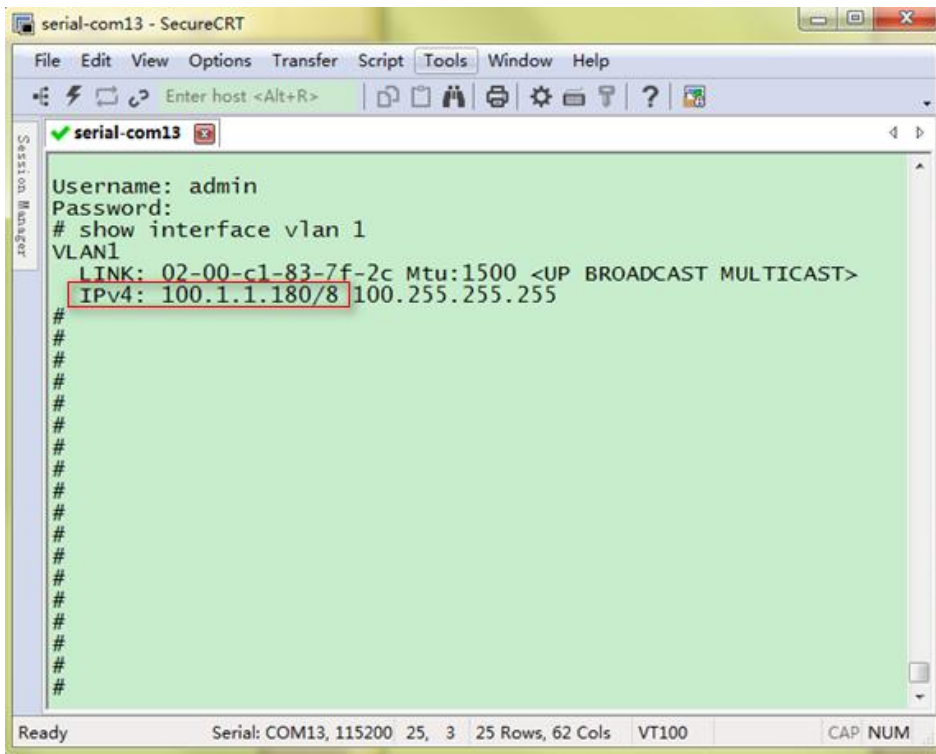

Figure 112 Displaying IP Address

2. Create IP interface

Hosts in different VLANs cannot communicate with each other. Their communication packets need to be forwarded by a router or Layer 3 switch through an IP interface.

This series switches support IP interfaces, which are virtual Layer 3 interfaces used for inter-VLAN communication. You can create one IP interface for each VLAN. The interface is used for forwarding Layer 3 packets of the ports in the VLAN.

3. Configure primary IP address

The primary IP address of the switch can be obtained by manual configuration and automatic, as shown below.

Path: Home >> Function Management >> IP Configuration : VLAN Interface Configuration

VLAN Interface Configuration Secondary IP

MTU	1500

Figure 114 IP address configuration

Method

Configuration options: None/DHCP/Manual

Function: Manual, you need to manually configure the IP address and subnet mask. The switch automatically gets the IP address through DHCP protocol as DHCP client if enable DHCP, in this case, there should be DHCP server to assign IP address and subnet mask to client in the network.

Address

Configuration format: A.B.C.D

Function: IP address of the Vlan interface.

Mask Length

Function: a subnet mask is a 32-bit number, consisting of a sequence "1" and a sequence "0". "1" corresponds to the network number field and the subnet number field, while "0"

corresponds to the host number field. The mask length is the number of 1 in the mask.

Client ID

Configuration options: Hex/ASCII/Port

Function: The detail filled information of carried option61 filed when specified IP send the DHCP requirement. Hex refers to filling option61 with type 01+mac address. ASCII refers to filling option61 with type 00+string. Port refers to filling option61 with the corresponding interface mac.

Hostname

Configuration range: 0-63 characters

Function: Configure the host name of the VLAN interface.

Fallback Address

Configuration format: A.B.C.D

Function: After the Vlan interface obtains the IP address timeout through the DHCP protocol, set the address to the fallback IP address.

Fallback Mask Length

Function: a subnet mask is a 32-bit number, consisting of a sequence "1" and a sequence "0". "1" corresponds to the network number field and the subnet number field, while "0" corresponds to the host number field. The mask length is the number of 1 in the mask.

Fallback Timeout

Configuration range: 0~4294967295s

Function: when the value is non-zero, the switch obtains the IP address attempt time through the DHCP protocol, need to configure the IP address manually at this time, after the attempt time out, the manually configured IP address takes effect. When the value is zero, the switch will try again and again until the IP address is obtained through the DHCP protocol, no need to manually configure the IP address.

MTU

Configuration range: 68~9600

Default configuration: 1500

Function: Configure the maximum packet length that can pass on the IP layer.

4. Secondary IP Configuration

Manually configure the secondary IP address of the switch's IP interface, as shown below.

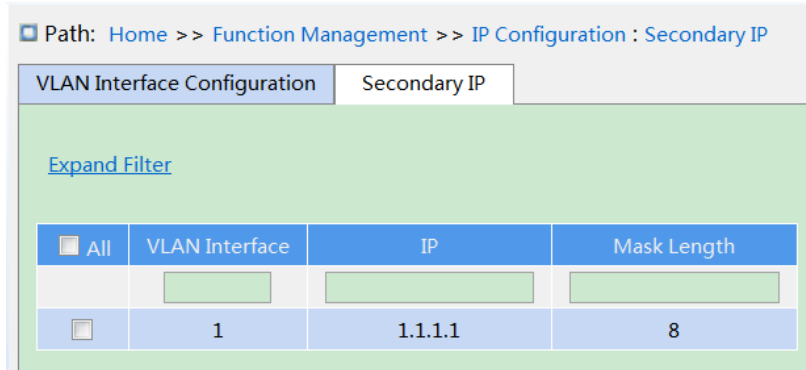

Figure 115 Secondary IP Configuration

VLAN Interface

Function: configure the VLAN property of the IP interface, and only this VLAN member port can access the current IP interface.

IP

Configure format: A.B.C.D

Function: manually configure IP address.

Mask Length

Function: a subnet mask is a 32-bit number, consisting of a sequence "1" and a sequence "0". "1" corresponds to the network number field and the subnet number field, while "0" corresponds to the host number field. The mask length is the number of 1 in the mask.

Caution:

- Each IP interface corresponds to a primary IP address and may correspond to multi-secondary IP addresses;
- Different IP interfaces should be configured with primary and secondary IP addresses for different network segments.

7.4 Port Aggregation

7.4.1 Static Aggregation

7.4.1.1 Introduction

Port channel is to bind a group of physical ports that have the same configuration to a logical port to increase bandwidth and improve transmission speed. The member ports in a same group share traffic and serve as dynamic backups for each other, improving connection reliability.

Port group is a physical port group on the configuration layer. Only the physical ports that join in port group can participate in link aggregation and become a member of port channel. When physical ports in a port group meet certain conditions, they can conduct port aggregation and form a port channel and become an independent logical port, thereby increasing network bandwidth and providing link backup.

7.4.1.2 Implementation

As shown in Figure 116, three ports on Switch A and Switch B aggregate to form a port channel. The bandwidth of the port channel is the total bandwidth of these three ports.

Figure 116 Port Channel

If Switch A sends packets to Switch B by way of the port channel, Switch A determines the member port for transmitting the traffic based on the calculation result of load sharing. When

one member port of the port channel fails, the traffic transmitted through the port is taken over by another normal port based on load sharing algorithm.

Caution:

- A port can be added to only one port group.
- Only full duplex ports can join an aggregation.
- The port in a port channel cannot be enabled LACP, and a port enabled LACP cannot be added to a port channel.
- Port channel and redundant port are mutually exclusive. The port in a port channel cannot be configured as a redundant port, and a redundant port cannot be added to a port channel.
- Redundant port in this document refers to DRP ring port, DRP backup port, RSTP port, and MSTP port.

7.4.1.3 Web Configuration

1. Static aggregation configuration, as shown below.

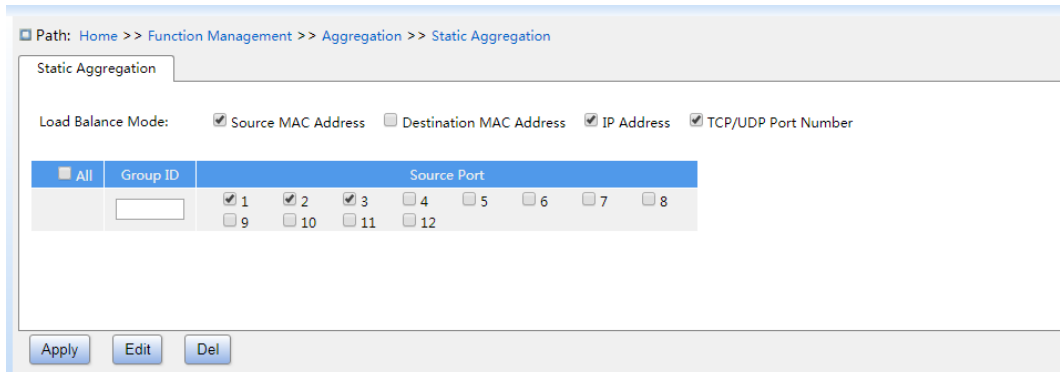

Figure 117 Static Aggregation Configuration

Load Balance Mode

Configuration options: Source MAC address/ destination MAC/IP address/ TCP/UDP port number

Default configuration: Source MAC address/IP address/ TCP/UDP port number

Function: configure load balance mode of aggregation group.

Description: the source mac address balances the traffic according to the source mac

address; the destination mac address balances the traffic according to the destination mac address; the IP address balances the traffic according to the IP address; the port number of TCP / UDP balances the traffic according to the TCP/UDP port number.

Group ID

Configuration range: 1-10

Function: Configure group ID.

Description: the member ports of the same aggregation group have the same port properties.

The number of aggregation groups depends on the device port, and each aggregation group supports up to 8 member ports.

Source Port

Configuration options: Enable/disable

Function: Select the port to join the specified aggregation group.

7.4.1.4 Typical Configuration Example

As shown in Figure 116, add three ports (port 1, 2, and 3) of Switch A to port group 1 and three ports (port 1, 2, and 3) of switch B to port group 1. Use network cables to connect these ports to form a port channel, realizing load sharing among ports. (It is assumed that the three ports on Switch A and B have the same attributes respectively).

Configuration on switches:

1. Add port 1, 2, and 3 of switch A to port group 1, as shown in Figure 117.
2. Add port 1, 2, and 3 of switch B to port group 1, as shown in Figure 117.

7.4.2 LACP

7.4.2.1 Introduction

Link Aggregation Control Protocol (LACP) is based on the IEEE802.3ad standard. It is used to exchange information with the peer port over Link Aggregation Control Protocol Data Unit (LACPDU), in order to select a member port in the dynamic aggregation group.

7.4.2.2 Implementation

A port enabled with LACP informs the peer port of its LACP priority of the local equipment, equipment MAC address, LACP priority of the port, port number and key value by sending an LACPDU message. The peer port negotiates with the local port after receiving the LACPDU message:

1. Compare the IDs of the equipment at both ends (equipment ID = equipment LACP priority+ equipment MAC address). At first, compare the LACP priorities. If the LACP priorities are the same, compare their MAC addresses. Select the equipment with a smaller ID as the master equipment.
2. Compare the port IDs of the master equipment (port ID = LACP priority of the port + port number). At first, compare the LACP priorities of the ports. If the port LACP priorities are the same, compare the port numbers. Select the port with a smaller ID as the reference port.
3. If this port and reference port have the same key values, and the same port attribute configurations in Up state, and the peer ports of this port and the reference port have the same key values and port attribute configurations, this port can become a member port of the dynamic aggregation group.

7.4.2.3 Web Configuration

1. Configure LACP priority, as shown below.

Figure 118 Configure LACP Priority

LACP

Configuration range: 1-65535

Default configuration: 32768

Function: Configure LACP priority, used to select the main device when LACP negotiation.

2. LACP Port Configuration, as shown below.

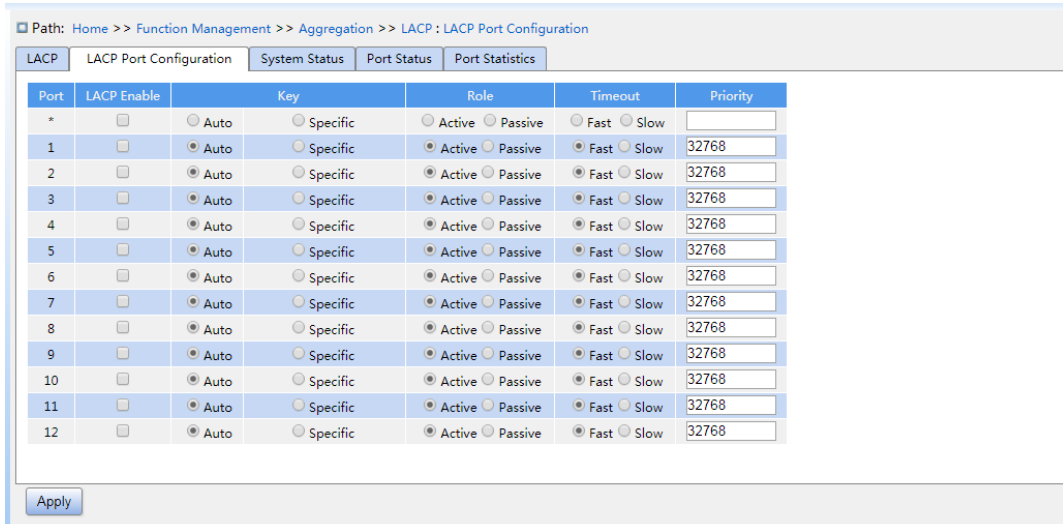

Figure 119 LACP port configuration

LACP Enable

Configuration options: Enable/disable

Default configuration: Diable

Function: whether enable LACP of port.

Key

Configuration options: Auto/specific (1~65535)

Default configuration: Auto

Function: Configure port key value. Key value is determined by port rate if selecting Auto, key=1 (10Mb); key=2 (100Mb); key=3 (1000Mb), ports with different key values cannot be added to dynamic aggregation groups.

Role

Configuration options: Active/passtive

Default configuration: Active

Function: select the role of the LACP. The active port will send the LACPDU message to the end port actively; the passive port receives the LACPDU message to the opposite end and sends the LACPDU message to the end port.

Caution:

At least one of the two ports connected is active, otherwise the two ends will not be able to exchange information.

Timeout

Configuration options: Fast/slow

Default configuration: Fast

Function: Configure the active port to send LACPDU message time interval. The fast refers to time interval is 1s and the slow refers to time interval is 30s.

Priority

Configuration range: 1~65535

Default configuration: 32768

Function: Configure port LACP priority, use to select reference ports. Ports with low priority in the main device are selected as reference ports.

3. View LACP system status, as shown below.

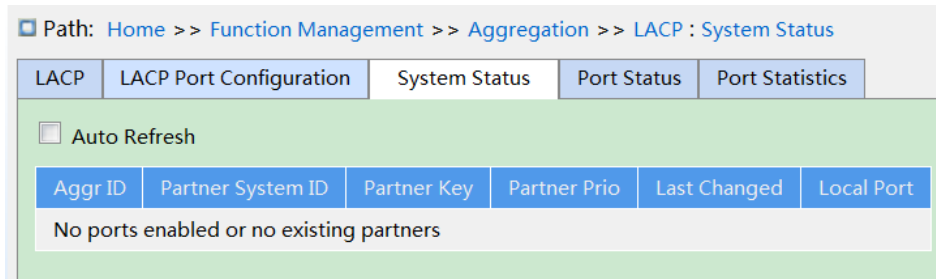

Figure 120 View LACP System Status

4. View LACP port status, as shown below.

Path: [Home](#) >> [Function Management](#) >> [Aggregation](#) >> [LACP : Port Status](#)

1	No	0	--	--	--	--
2	No	0	--	--	--	--
3	No	0	--	--	--	--
4	No	0	--	--	--	--
5	No	0	--	--	--	--
6	No	0	--	--	--	--
7	No	0	--	--	--	--
8	No	0	--	--	--	--

Figure 121 View LACP port status

LACP Status

Displaying options: Yes/No

Function: Display LACP status of port. "Yes" refers to LACP is enable and port is up status.

"No" refers to LACP is disable and port is down status

5. View LACP port statistics, as shown below.

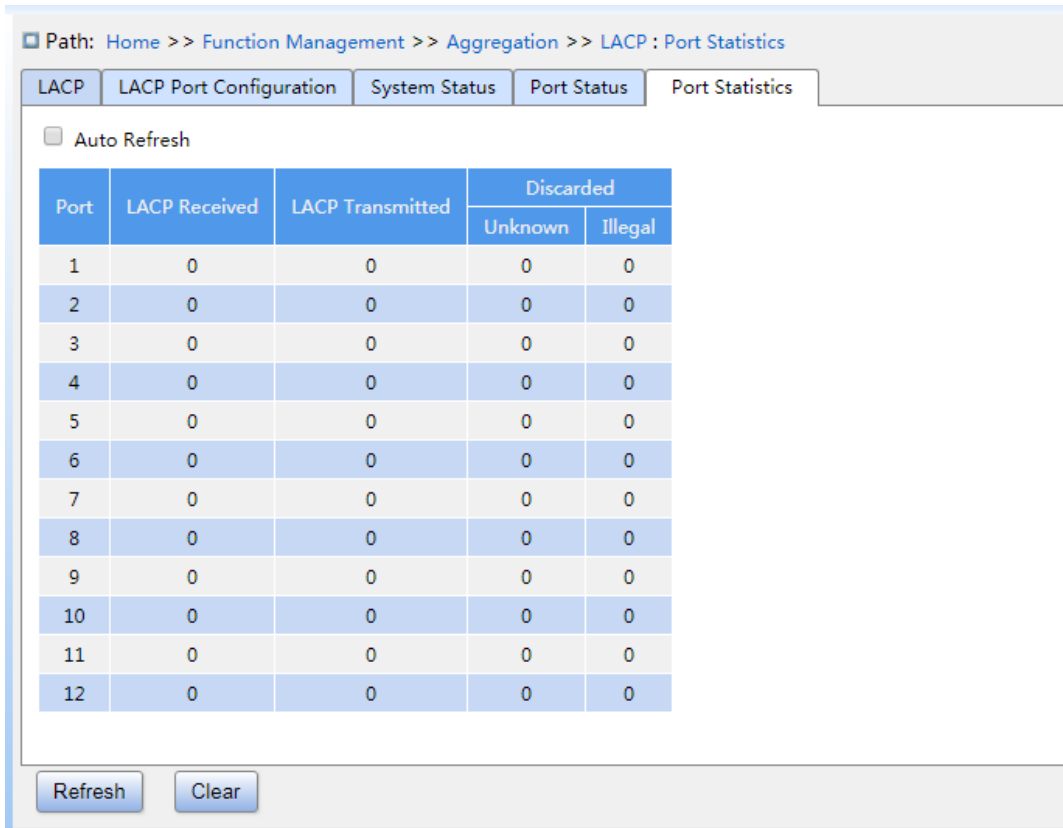

Figure 122 View LACP Port Statistics

7.4.2.4 Typical Configuration Example

As shown in Figure 116, add three ports (port 1, 2, and 3) of Switch A to port group 1 and three ports (port 1, 2, and 3) of switch B to port group 1. Use network cables to connect these ports to form a port channel, realizing load sharing among ports. (It is assumed that the three ports on Switch A and B have the same attributes respectively).

Configuration on switches:

1. Enable LACP on port 1, 2, and 3 of switch A , as shown in Figure 119.
2. Enable LACP on port 1, 2, and 3 of switch B , as shown in Figure 119.

7.5 Redundancy

7.5.1 DRP

7.5.1.1 Overview

Kyland develops the Distributed Redundancy Protocol (DRP) for data transmission on ring-topology networks. It can prevent broadcast storms for ring networks. When a link or node is faulty, the backup link can take over services in real time to ensure continuous data transmission.

Compliant with the IEC 62439-6 standard, DRP uses the master election mechanism with no fixed master. DRP provides the following features:

➤ Network scale-independent recovery time

DRP achieves network scale-independent recovery time by optimizing the ring detection packet forwarding mechanism. DRP enables networks to recover within 20ms, with the introduction of real-time reporting interruption, improving reliability for real-time data transmission. This feature enables switches to provide higher reliability for the applications in the power, rail transit, and many other industries that require real-time control.

➤ Diversified link detection functions

To improve network stability, DRP provides diversified link detection functions for typical network faults, including fast disconnection detection, optical fiber unidirectional link detection, link quality inspection, and equipment health check, ensuring proper data transmission.

➤ Applicable to multiple network topologies

Besides rapid recovery for simple ring networks, DRP also supports complex ring topologies, such as intersecting rings and tangent rings. Additionally, DRP supports VLAN-based multiple instances, thereby suiting various network applications with flexible networking.

➤ Powerful diagnosis and maintenance functions

DRP provides powerful status query and alarm mechanisms for network diagnosis and maintenance, as well as mechanism for preventing unintended operation and incorrect configurations that may lead to ring network storms.

7.5.1.2 Concept

1. DRP Modes

DRP involves two modes: DRP-Port-Based and DRP-VLAN-Based.

DRP-Port-Based: forwards or blocks packets based on specific ports.

DRP-VLAN-Based: forwards or blocks packets based on VLANs. If a port is in blocking state, only the data packets of the specified VLAN are blocked. Therefore, multiple VLANs can be configured on tangent ring ports. A port can belong to different DRP rings according to VLAN configurations.

2. DRP Port Statuses

Forwarding state: If a port is in forwarding state, it can receive and forward data packets.

Blocking state: If a port is in blocking state, it can receive and forward DRP packets, but not other data packets.

Primary port: indicates the ring port (on the root) whose status is configured as forwarding forcibly by user when the ring is closed.

Caution:

- If no primary port is configured on the root, the first port whose link status changes to up when the ring is closed is in forwarding state. The other ring port is in blocking state.
- A port in blocking state on the Root can proactively send DRP packets.

3. DRP Roles

DRP determines the roles of switches by forwarding Announce packets, preventing redundancy rings to form loops.

INIT: indicates the device on which DRP is enabled and the two ring ports are in Link down state.

Root: indicates the device on which DRP is enabled and at least one ring port is in Link up state. In a ring, the Root is elected according to the vectors of Announce packets. It may change with the network topology. The Root sends its own Announce packets to other devices periodically. Statuses of ring ports: One ring port is in forwarding state and the other is in blocking state. Upon receiving the Announce packet of another device, the Root

compares the vector of the packet with that of its own Announce packet. If the vector of the received packet is larger, the Root changes its role to Normal or B-Root according to the link status and CRC degradation of ports.

B-Root: indicates the device on which DRP is enabled, meeting at least one of the following conditions: one ring port is in Link up state while the other is in Link down, CRC degradation, the priority is not less than 200. The B-Root compares and forwards Announce packets. If the vector of a received Announce packet is smaller than that of its own announce packet, the B-Root changes its role to Root; otherwise, it forwards the received packet and does not change its own role. Statuses of ring ports: One ring port is in forwarding state.

Normal: indicates the device on which DRP is enabled and both ring ports are in Link up state without CRC degradation and the priority is more than 200. The Normal only forwards Announce packets, but does not check the content of packets. Statuses of ring ports: Both ring ports are in forwarding state.

Note:

CRC degradation: indicates that the number of CRC packets exceed the threshold in 15 minutes.

7.5.1.3 Implementation

Each switch maintains its own vector of Announce packet. The switch with the larger vector will be elected as the Root.

The vector of Announce packet contains the following information for role assignment.

Table 5 Vector of Announce Packet

Link	CRC degradation		Role	IP address of	MAC address
status	CRC degradation status	CRC degradation rate	priority	the device	of the device

Link status: The value is set to 1 if one ring port is in Link down state and set to 0 if both ring ports are in Link up state.

CRC degradation status: If CRC degradation occurs on one port, the value is set to 1. If CRC degradation does not occur on the two ring ports, the value is set to 0.

CRC degradation rate: The ratio of the number of CRC packets and the threshold in 15 minutes.

Role priority: The value can be set on the Web UI.

The parameters in Table 5 Vector of Announce Packet are compared in the following procedure:

1. The value of link status is checked first. The device with a larger link status value is considered to have a larger vector.
2. If the two compared devices have the same link status value, the values of CRC degradation status are compared. The device with a larger CRC degradation status value is considered to have a larger vector. If the CRC degradation status value of all compared devices is 1, the device with a larger CRC degradation rate value is considered to have a larger vector.
3. If the two compared devices have the same link status value and CRC degradation value, the values of role priority, IP addresses, and MAC addresses are compared sequentially. The device with a larger value is considered to have a larger vector.
4. The device with the larger vector is elected as the Root.

**Note:**

Only when CRC degradation status value is 1, the CRC degradation rate value participates in vector comparison. Otherwise, the vectors are compared regardless of CRC degradation rate value.

➤ Implementation of DRP-Port-Based mode

The roles of switches are as follows:

1. Upon startup, all switches are in INIT state. When the state of one port changes to Link up, the switch becomes the Root and sends Announce packets to the other switches in the ring for election.
2. The switch with the largest vector of Announce packet is elected as the Root. The ring port that links up first on the Root is in forwarding state and the other ring port is in blocking state. Among the other switches in the ring, the switch with one ring port in Link

down or CRC degradation state is the B-Root. The switch with both ring ports in Link up state and no CRC degradation is the Normal.

The fault recovery procedure is shown in Figure 123 :

1. In the initial topology, A is the Root; port 1 is in forwarding state and port 2 in blocking state. B, C, and D are Normal(s), and their ring ports are in forwarding state.
2. When link CD is faulty, DRP changes the statuses of port 6 and port 7 to blocking. As a result, C and D become the Roots. Because A, C, and D are Roots at the moment, they all send Announce packets. The vectors of C and D are larger than that of A because port 7 and port 6 are in Link down status. In this case, if the vector of D is larger than that of C, D is elected as the Root and C becomes the B-Root. When receiving the Announce packet of D, A finds that the vector of D is larger than its own vector and both its ring ports are in Link up state. Therefore, A becomes a Normal and changes the status of port 2 to forwarding.
3. When link CD recovers, D is still the Root because its vector is larger than the vector of C.
 - If no primary port is configured on D, port 7 is still in blocking state and port 8 is in forwarding state.
 - If port 7 on D is configured as primary port, port 7 changes to forwarding state and port 8 is in blocking state.

DRP changes the state of port 6 to forwarding. As a result, C becomes a Normal. Therefore, the roles of switches do not change for link recovery.

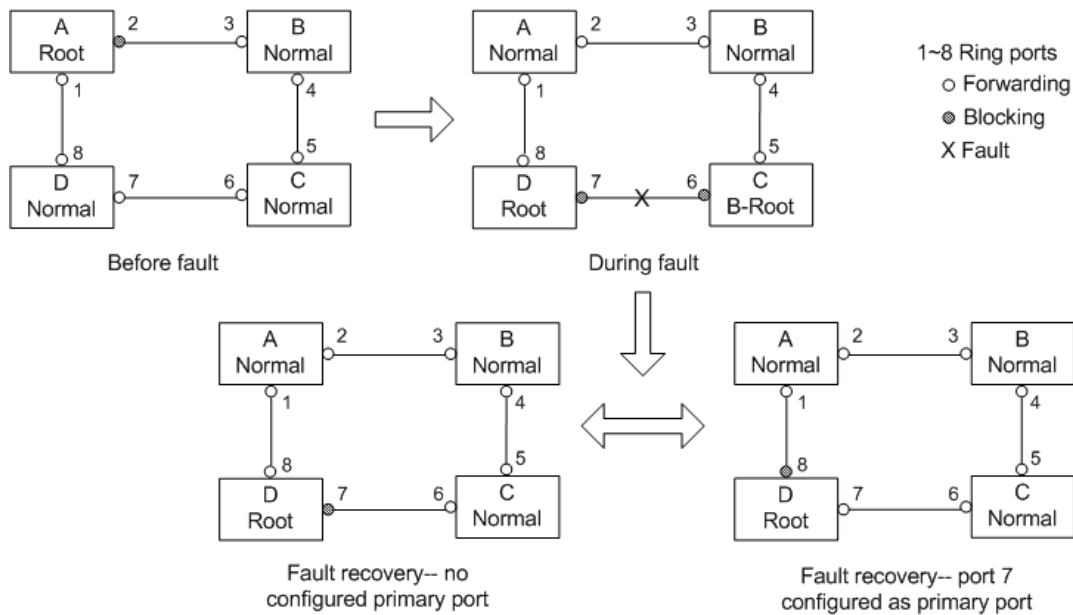

Figure 123 DRP Link Fault

Note:

On a DRP ring network, the roles of switches change upon a link fault, but do not change when the link recovers. This mechanism improves network security and reliability of data transmission.

➤ Implementation of DRP-VLAN-Based mode

DRP-VLAN-Based ring allows the packets of different VLANs to be forwarded in different paths. Each forwarding path for a VLAN forms a DRP-VLAN-Based. Different DRP-VLAN-Based ring can have different roots. As shown in the following figure, two DRP-VLAN-Based rings are configured.

Ring links of DRP-VLAN10/20-Based: AB-BC-CD-DE-EA.

Ring links of DRP-VLAN30-Based: FB-BC-CD-DE-EF.

The two rings are tangent at link BC, CD, and DE. Switch C and Switch D share the same ports in the two rings, but use different logical links based on VLANs

Figure 124 DRP-VLAN-Based

Note:

The port status and role assignment of each DRP-VLAN-Based ring are the same as those of DRP-Port-Based ring.

➤ DRP Backup

DRP can also provide backup for two DRP rings, preventing loops and ensuring normal communication between rings.

Backup port: indicates the communication port between DRP rings. Multiple backup ports can be configured, but must be in the same ring. The first backup port that links up is the master backup port, which is in forwarding state. All the other backup ports are slave. They are in blocking state.

As shown in Figure 125, one backup port can be configured on each switch. The master backup port is in forwarding state and the other backup ports are in blocking state. If the master backup port or its link is faulty, a slave backup port will be selected to forward data.

Figure 125 DRP Backup

Caution:

Link status change affects the status of backup ports.

7.5.2 RSTP/STP Configuration

7.5.2.1 Introduction

Standardized in IEEE802.1D, the Spanning Tree Protocol (STP) is a LAN protocol used for preventing broadcast storms caused by link loops and providing link backup. STP-enabled devices exchange packets and block certain ports to prune "loops" into "trees", preventing proliferation and endless loops. The drawback of STP is that a port must wait for twice the forwarding delay to transfer to the forwarding state.

To overcome the drawback, IEEE creates 802.1w standard to supplement 802.1D.

IEEE802.1w defines the Rapid Spanning Tree Protocol (RSTP). Compared with STP, RSTP achieves much more rapid convergence by adding alternate port and backup port for the root port and designated port respectively. When the root port is invalid, the alternate port can enter the forwarding state quickly.

7.5.2.2 Concepts

Root bridge: serves as the root for a tree. A network has only one root bridge. The root

bridge changes with network topology. The root bridge periodically sends BPDU to the other devices, which forward the BPDU to ensure topology stability.

Root port: indicates the best port for transmission from the non-root bridges to the root bridge. The best port is the port with the smallest cost to the root bridge. A non-root bridge communicates with the root bridge through the root port. A non-root bridge has only one root port. The root bridge has no root port.

Designated port: indicates the port for forwarding BPDU to other devices or LANs. All ports on the root bridge are designated ports.

Alternate port: indicates the backup port of the root port. If the root port fails, the alternate port becomes the new root port.

Backup port: indicates the backup port of the designated port. When a designated port fails, the backup port becomes the new designated port and forwards data.

7.5.2.3 BPDU Configuration Messages

To prevent loops, all the bridges of a LAN calculate a spanning tree. The calculation process involves transmitting BPDUs among devices to determine the network topology. Table 6 shows the data structure of a BPDU.

Table 6 BPDU

...	Root bridge ID	Root path cost	Designated bridge ID	Designated port ID	Message age	Max age	Hello time	Forward delay	...
...	8 bytes	4 bytes	8 bytes	2 bytes	2 bytes	2 bytes	2 bytes	2 bytes	...

Root bridge ID: priority of the root bridge (2 bytes) +MAC address of the root bridge (6 bytes).

Root path cost: cost of the path to the root bridge.

Designated bridge ID: priority of the designated bridge (2 bytes) +MAC address of the designated bridge (6 bytes).

Designated port ID: port priority+port number.

Message age: duration that a BPDU can be spread in a network.

Max age: maximum duration that a BPDU can be saved on a device. When Message age is

larger than Max age, the BPDU is discarded.

Hello time: interval for sending BPDUs.

Forward delay: status change delay (discarding--learning or learning--forwarding).

7.5.2.4 Implementation

The process for all bridges calculating the spanning tree with BPDUs is as follows:

1. In the initial phase

Each port of all devices generates the BPDU with itself as the root bridge; both root bridge ID and designated bridge ID are the ID of the local device; the root path cost is 0; the designated port is the local port.

2. Best BPDU selection

All devices send their own BPDUs and receive BPDUs from other devices. Upon receiving a BPDU, each port compares the received BPDU with its own.

- If the priority of its own BPDU is higher, then the port does not perform any operation.
- If the priority of the received BPDU is higher, then the port replaces the local BPDU with the received one.

Devices compare the BPDUs of all ports and figure out the best BPDU. Principles for comparing BPDUs are as follows:

- The BPDU with a smaller root bridge ID has a higher priority.
- If the root bridge IDs of two BPDUs are the same, their root path costs are compared. If the root path cost in a BPDU plus the path cost of the local port is smaller, then the priority of the BPDU is higher.
- If the root path costs of two BPDUs are also the same, the designated bridge IDs, designated port IDs, and IDs of the port receiving the BPDUs are further compared in order. The BPDU with a smaller ID has a higher priority. The BPDU with a smaller root bridge ID has a higher priority.

3. Selection of the root bridge

The root bridge of the spanning tree is the bridge with the smallest bridge ID.

4. Selection of the root port

A non-root-bridge device selects the port receiving the best BPDU as the root port.

5. BPDU calculation of the designated port

Based on the BPDU of the root port and the path cost of the root port, a device calculates a designated port BPDU for each port as follows:

- Replace the root bridge ID with the root bridge ID of the BPDU of the root port.
- Replace the root path cost with the root path cost of the root port BPDU plus the path cost of the root port.
- Replace designated bridge ID with the ID of the local device.
- Replace the designated port ID with the ID of the local port.

6. Selection of the designated port

If the calculated BPDU is better, then the device selects the port as the designated port, replaces the port BPDU with the calculated BPDU, and sends the calculated BPDU. If the port BPDU is better, then the device does not update the port BPDU and blocks the port. Blocked ports can receive and forward only RSTP packets, but not other packets.

7.5.2.5 Web Configuration

1. Set the time parameters of the network bridge, as shown below.

Path: Home >> Function Management >> Redundancy >> Spanning Tree : Bridge Settings

Bridge Settings	MSTI Mapping	MSTI Priorities	CIST Ports	MSTI Ports	Bridge Status	Port Status	Port Statistics
Enable	<input checked="" type="checkbox"/>						
Protocol Version	RSTP						
Bridge Priority	32768						
Hello Time	2 (Second(s))						
Forward Delay	15 (Second(s))						
Max Age	20 (Second(s))						
Maximum Hop Count	20						
Transmit Hold Count	6						
Edge Port BPDU Filtering	<input type="checkbox"/>						
Port Error Recovery	<input type="checkbox"/>						
Port Error Recovery Timeout							

Apply

Figure 126 Setting Time Parameters of the Network Bridge

Global Configuration

Configuration options: Enable/Disable

Default configuration: Disable

Function: Disable or enable spanning tree.

Caution:

- Port-based ring protocols include RSTP and VLAN-based ring protocols include MSTP and DRP-VLAN.
- Port-based ring protocol and VLAN-based ring protocol are mutually exclusive, and only one ring protocol mode can be selected for one device.

Protocol Priority

Configuration options: MSTP/RSTP/STP

Default configuration: MSTP

Function: Select the spanning tree protocol.

Bridge Priority

Configuration range: 0~61440. The step is 4096.

Default configuration: 32768

Function: Configure the priority of the network bridge.

Description: The priority is used for selecting the root bridge. The smaller the value, the higher the priority.

Hello Time

Configuration range: 1~10s

Default configuration: 2s

Function: Configure the interval for sending BPDU.

Forward Delay

Configuration range: 4~30s

Default configuration: 15s

Function: Configure status change time from Discarding to Learning or from Learning to

Forwarding.

Max Age

Configuration range: 6~40s

Default configuration: 20s

Function: Maximum duration that a BPDU can be saved on a device.

Description: If the value of message age in the BPDU is larger than the specified value, then the BPDU is discarded.

Caution:

- The values of Forward Delay Time, Hello Time and Max Age Time should meet the following requirements: $2 * (\text{Forward Delay Time} - 1.0 \text{ seconds}) \geq \text{Max Age Time}$; $\text{Max Age Time} \geq 2 * (\text{Hello Time} + 1.0 \text{ seconds})$.
- The default setting is recommended.

Maximum Hop Count

Configuration range: 6~40

Default configuration: 20

Function: Configure the maximum hops of MST region. The maximum hops of MST region limit the scale of MST region; the maximum number of hops of regional root is the maximum number of hops of MST region.

Description: Starting from the root bridge of spanning tree in MST region, the hop number deducts 1 when the BPDU passes through a device in the region. Device drops the BPDU with the hop number of 0.

Caution:

- Only the maximum hop configuration of root bridge in MST region is valid. Non-root bridge device adopts the maximum hop configuration of root bridge.
- The default setting is recommended.

Transmit Hold Count

Configuration range: 1~10

Default configuration: 6

Function: Set the maximum number of BPDU packets that can be sent by a port within each Hello Time.

Edge Port BPDU Filtering

Configuration options: Enable/Disable

Default configuration: Disable

Function: Control whether an edge port receives and forwards BPDU packets.

Port Error Recovery

Configuration options: Enable/Disable

Default configuration: Disable

Function: Control whether a port can automatically recover from the error state to the normal state.

Port Error Recovery Timeout

Configuration range: 30~86400s

Function: Set the time for a port to recover from the error state to the normal state.

2. Configure RSTP port, as shown below.

Path: Home >> Function Management >> Redundancy >> Spanning Tree : CIST Ports

Apply

Figure 127 Configure RSTP Port

STP Enabled

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable or disable STP/RSTP on ports.

Caution:

- RSTP port and port channel are mutually exclusive. A RSTP port cannot be added to a port channel; a port in a port channel cannot be configured as a RSTP port.
- Ring ports between port-based ring protocols RSTP, DT-Ring-Port, and DRP-Port are mutually exclusive, that is, a RSTP port cannot be configured as DRP-Port/DT-Ring-Port ring port, or DRP-Port/DT-Ring-Port backup port; DRP-Port/DT-Ring-Port ring port, and DRP-Port/DT-Ring-Port backup port cannot be configured as a RSTP port.

Path Cost

Configuration options: Auto/Specific (1~200000000)

Default configuration: Auto

Description: The path cost of a port is used to calculate the best path. The value of the parameter depends on the bandwidth. The larger the value, the lower the cost. You can change the role of a port by changing the value of the path cost parameter. To configure the value manually, select No for Cost Count.

Priority

Configuration range: 0~240. The step is 16.

Default configuration: 128

Function: Configure the port priority, which determines the roles of ports.

Admin Edge

Configuration options: Non-Edge/Edge

Default configuration: Non-Edge

Function: Set whether the current port is an edge port.

Description: When a port is directly connected to a terminal and is not connected to other devices or a shared network segment, the port is considered as an edge port. An edge port can rapidly migrate from the blocking state to the forwarding state without waiting delay. After

an edge port receives BPDU packets, it becomes a non-edge port.

Auto Edge

Configuration options: Enable/Disable

Default configuration: Enable

Function: Specify whether to enable the automatic detection function of an edge port.

Restricted Role

Configuration options: Enable/Disable

Default configuration: Disable

Function: A restricted port will be never selected as a root node even if it is granted the highest priority.

Restricted TCN

Configuration options: Enable/Disable

Default configuration: Disable

Function: A port with restricted TCN will not actively send TCN messages.

BPDU Guard

Configuration options: Enable/Disable

Default configuration: Disable

Function: Control whether an edge port enters the Error-Disable state and is shut down when receiving BPDU packets.

Point-to-point

Configuration options: Auto/Forced True/Forced False

Default configuration: Auto

Function: Set the connection type for a port. If a port is connected to a point-to-point link, the port can rapidly migrate to another state.

Description: **Auto** indicates that the switch automatically detects the link type based on the duplex status of a port. When a port works in full-duplex mode, the switch considers that the type of the link connected to the port is point-to-point; when a port works in half-duplex mode, the switch considers that the type of the link connected to the port is shared. Forced point-to-point refers that a link connected to a port is a point-to-point link and forced sharing refers that a link connected to a port is a shared link.

7.5.2.6 Typical Configuration Example

The priorities of Switch A, B, and C are 0, 4096, and 8192. Path costs of links are 4, 5, and 10, as shown in Figure 128.

Figure 128 RSTP Configuration Example

Configuration on Switch A:

1. Set bridge priority to 0 and time parameters to default values, as shown in Figure 126.
2. Set the path cost of port 1 to 5 and that of port 2 to 10, as shown in Figure 127.

Configuration on Switch B:

1. Set bridge priority to 4096 and time parameters to default values, as shown in Figure 126.
2. Set the path cost of port 1 to 5 and that of port 2 to 4, as shown in Figure 127.

Configuration on Switch C:

1. Set bridge priority to 8192 and time parameters to default values, as shown in Figure 126.
2. Set the path cost of port 1 to 10 and that of port 2 to 4, as shown in Figure 127.

- The priority of Switch A is 0 and its root ID is the smallest. Therefore, Switch A is the root bridge.
- The path cost from AP1 to BP1 is 5 and that from AP2 to BP2 is 14. Therefore, BP1 is the root port.

- The path cost from AP1 to CP2 is 9 and that from AP2 to CP1 is 10. Therefore, CP2 is the root port and BP2 is the designated port.

7.5.3 MSTP Configuration

7.5.3.1 Introduction

Although RSTP achieves rapid convergence, it also has the following defect just as the STP: all bridges in the LAN share one spanning tree and packets of all VLANs are forwarded along the spanning tree. As shown in Figure 129, certain configurations may block the link between switch A and switch C. Because switch B and switch D are not in VLAN 1, they cannot forward the packets of VLAN 1. As a result, the VLAN 1 port of switch A cannot communicate with that of switch C.

Figure 129 RSTP Disadvantage

To solve this problem, the Multiple Spanning Tree Protocol (MSTP) came into being. It achieves both rapid convergence and separate forwarding paths for the traffic of different VLANs, providing a better load sharing mechanism for redundant links.

MSTP maps one or multiple VLANs into one instance. Switches with the same configuration form a region. Each region contains multiple mutually independent spanning trees. The region serves as a switch node. It participates in the calculation with other regions based on the spanning tree algorithm, calculating an overall spanning tree. Based on this algorithm,

the network in Figure 129 forms the topology shown in Figure 130 . Both switch A and switch C are in Region1. No link is blocked because the region contains no loops. This is the same with Region2. Region1 and Region2 are similar to switch nodes. These two "switches" form a loop. Therefore, a link should be blocked.

Figure 130 MSTP Topology

7.5.3.2 Basic Concepts

Learn MSTP concepts based on Figure 131 and Figure 134.

Figure 131 MSTP Concepts

Figure 132 VLAN 1 Mapping to Instance 1

Figure 133 VLAN2 Mapping to Instance 2

Figure 134 Other VLAN Mapping to Instance 0

Instance: a collection of multiple VLANs. One VLAN (as shown in Figure 132 and Figure 133) or multiple VLANs with the same topology (as shown in Figure 134) can be mapped to one instance; that is, one VLAN can form a spanning tree and multiple VLANs can share one spanning tree. Different instances are mapped to different spanning trees. Instance 0 is the spanning tree for the devices of all regions, while the other instances are the spanning trees for the devices of a specific region.

Multiple Spanning Tree Region (MST region): Switches with the same MSTP region name, revision level, and VLAN-to-instance mapping are in the same MST region. As shown in Figure 131, Region1, Region2, Region3, and Region4 are four different MST regions.

VLAN mapping table: consists of the mapping between VLANs and spanning trees. In Figure 131, VLAN mapping table of region 2 is the mapping between VLAN 1 and instance 1, as shown in Figure 132; VLAN 2 is mapped to instance 2, as shown in Figure 133. The other VLANs are mapped to instance 0, as shown in Figure 134.

Common and Internal Spanning Tree (CIST): indicates instance 0, that is, the spanning tree covering all the devices on a switching network. As shown in Figure 131, the CIST comprises IST and CST.

Internal Spanning Tree (IST): indicates the CIST segment in the MST region, that is, instance 0 of each region, as shown in Figure 134.

Common Spanning Tree (CST): indicates the spanning tree connecting all MST regions in a switching network. If each MST region is a device node, the CST is the spanning tree calculated based on STP/RSTP by these device nodes. As shown in Figure 131, the red lines indicate the spanning tree.

MSTI (Multiple Spanning Tree Instance): one MST region can form multiple spanning trees and they are independent of each other. Each spanning tree is a MSTI, as shown in Figure 132 and Figure 133. IST is also a special MSTI.

Common root: indicates the root bridge of the CIST. The switch with the smallest root bridge ID in a network is the common root.

In an MST region, spanning trees have different topologies, and their regional roots can also be different. As shown in Figure 132, Figure 133, and Figure 134, the three instances have different regional roots. The root bridge of the MSTI is calculated based on STP/RSTP in the current MST region. The root bridge of the IST is the device that is connected to another MST region and selected based on the priority information received.

Boundary port: indicates the port that connects an MST region to another MST region, STP running region, or RSTP running region.

Port state: A port can be in either of the following states based on whether it is learning MAC addresses and forwarding traffic.

Forwarding state: indicates that a port learns MAC addresses and forwards traffic.

Learning state: indicates that a port learns MAC addresses but does not forward traffic.

Discarding state: indicates that a port neither learns MAC addresses nor forwards traffic.

Root port: indicates the best port from a non-root bridge to the root bridge, that is, the port with the smallest cost to the root bridge. A non-root bridge communicates with the root bridge through the root port. A non-root bridge has only one root port. The root bridge has no root port. The root port can be in forwarding, learning, or discarding state.

Designated port: indicates the port for forwarding BPDU to other devices or LANs. All ports on the root bridge are designated ports. The designated port can be in forwarding, learning, or discarding state.

Master port: indicates the port that connects an MST region to the common root. The port is in the shortest path to the common root. From the CST, the master port is the root port of a region (as a node). The master port is a special boundary port. It is the root port for the CIST and master port for other instances. The master port can be in forwarding, learning, or discarding state.

Alternate port: indicates the backup port of the root port or master port. When the root port or master port fails, the alternate port becomes the new root port or master port. The master port can only be in discarding state.

Backup port: indicates the backup port of the designated port. When a designated port fails, the backup port becomes the designated port and forwards data without any delay. The backup port can only be in discarding state.

7.5.3.3 MSTP Implementation

MSTP divides a network into multiple MST regions. CST is calculated between regions. Multiple spanning trees are calculated in a region. Each spanning tree is an MSTI. Instance 0 is the IST, and other instances are MSTIs.

1. CIST calculation

- A device sends and receives BPDU packets. Based on the comparison of MSTP configuration messages, the device with the highest priority is selected as the common root of the CIST.

- An IST is calculated in each MST region.
- Each MST region is considered as a single device and CST is calculated between regions.
- CST and IST constitute the CIST of the entire network.

2. MSTI calculation

In an MST region, MSTP generates different spanning trees for VLANs based on the mapping between VLANs and spanning trees. Each spanning tree is calculated independently. The calculation process is similar to that in STP.

In an MST region, VLAN packets are forwarded along corresponding MSTIs. Between MST regions, VLAN packets are forwarded along the CST.

7.5.3.4 Web Configuration

1. Set the time parameters of the network bridge, as shown below.

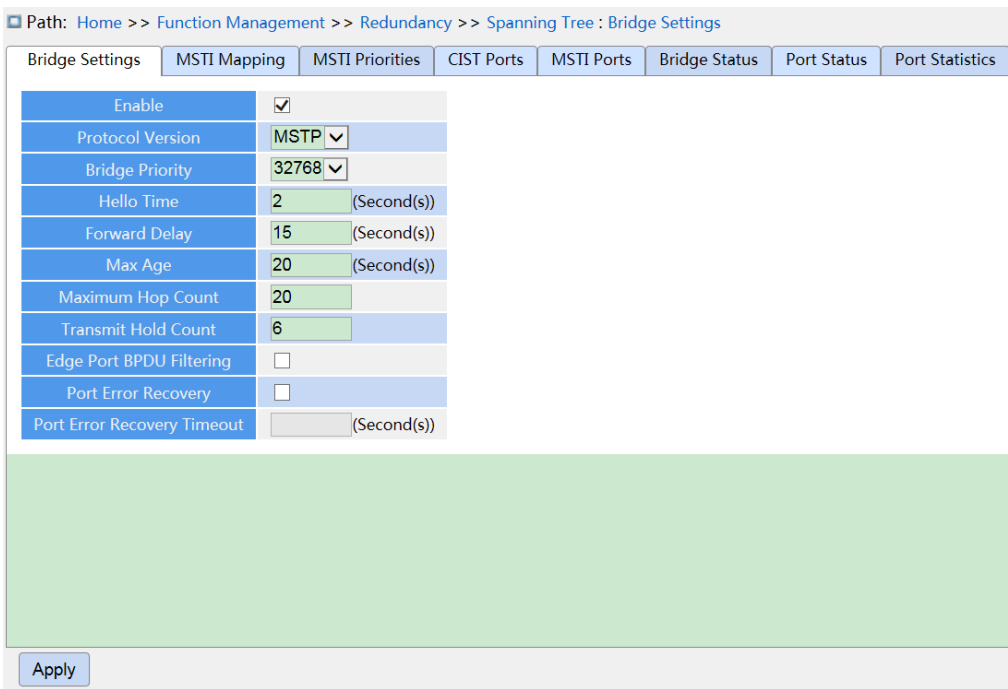

Figure 135 Setting Time Parameters of the Network Bridge

Global Configuration

Configuration options: Enable/Disable

Default configuration: Disable

Function: Disable or enable spanning tree.

Caution:

- Port-based ring protocols include RSTP, and DRP-Port, and VLAN-based ring protocols include MSTP and DRP-VLAN.
- Port-based ring protocol and VLAN-based ring protocol are mutually exclusive, and only one ring protocol mode can be selected for one device.

Protocol Priority

Configuration options: MSTP/RSTP/STP

Default configuration: MSTP

Function: Select the spanning tree protocol.

Bridge Priority

Configuration range: 0~61440. The step is 4096.

Default configuration: 32768

Function: Configure the priority of the network bridge.

Description: The priority is used for selecting the root bridge. The smaller the value, the higher the priority.

Hello Time

Configuration range: 1~10s

Default configuration: 2s

Function: Configure the interval for sending BPDU.

Forward Delay

Configuration range: 4~30s

Default configuration: 15s

Function: Configure status change time from Discarding to Learning or from Learning to Forwarding.

Max Age

Configuration range: 6~40s

Default configuration: 20s

Function: Maximum duration that a BPDU can be saved on a device.

Description: If the value of message age in the BPDU is larger than the specified value, then the BPDU is discarded.

Caution:

- The values of Forward Delay Time, Hello Time and Max Age Time should meet the following requirements: $2 * (\text{Forward Delay Time} - 1.0 \text{ seconds}) \geq \text{Max Age Time}$; $\text{Max Age Time} \geq 2 * (\text{Hello Time} + 1.0 \text{ seconds})$.
- The default setting is recommended.

Maximum Hop Count

Configuration range: 6~40

Default configuration: 20

Function: Configure the maximum hops of MST region. The maximum hops of MST region limit the scale of MST region; the maximum number of hops of regional root is the maximum number of hops of MST region.

Description: Starting from the root bridge of spanning tree in MST region, the hop number deducts 1 when the BPDU passes through a device in the region. Device drops the BPDU with the hop number of 0.

Caution:

- Only the maximum hop configuration of root bridge in MST region is valid. Non-root bridge device adopts the maximum hop configuration of root bridge.
- The default setting is recommended.

Transmit Hold Count

Configuration range: 1~10

Default configuration: 6

Function: Set the maximum number of BPDU packets that can be sent by a port within each Hello Time.

Edge Port BPDU Filtering

Configuration options: Enable/Disable

Default configuration: Disable

Function: Control whether an edge port receives and forwards BPDU packets.

Port Error Recovery

Configuration options: Enable/Disable

Default configuration: Disable

Function: Control whether a port can automatically recover from the error state to the normal state.

Port Error Recovery Timeout

Configuration range: 30~86400s

Function: Set the time for a port to recover from the error state to the normal state.

2. Configure MSTI mapping, as shown below.

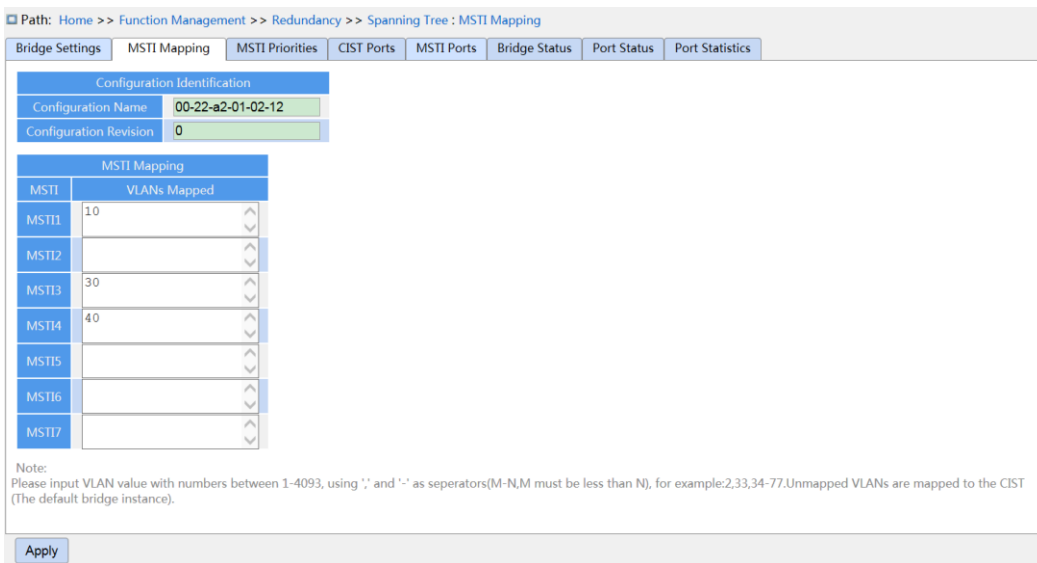

Figure 136 Configure MSTI Mapping

Configuration Name

Configuration range: 1-32 characters

Default configuration: device MAC address

Function: Configure the name of MST region.

Configuration Revision

Configuration options: 0~65535

Default configuration: 0

Function: Configure the revision parameter of MSTP region.

Description: Revision parameter, MST region name, and VLAN mapping table codetermines the MST region that the device belongs to. When all configurations are the same, the devices are in same MST region.

VLANs Mapped

Configuration range: 1~4094

Function: Configure the VLAN mapping table in MST region. When there are multiple VLANs, you can separate the VLANs by a comma (,) and an en dash (-), where an en dash is used to separate two consecutive VLAN IDs and a comma is used to separate two inconsecutive VLAN IDs.

Description: By default, all VLANs map to instance 0. One VLAN maps to only one spanning tree instance. If a VLAN with an existing mapping is mapped to another instance, the previous mapping is cancelled. If the mapping between the designated VLAN and instance is deleted, this VLAN will be mapped to instance 0.

3. Configure the bridge priority of the switch in designated instance, as shown below.

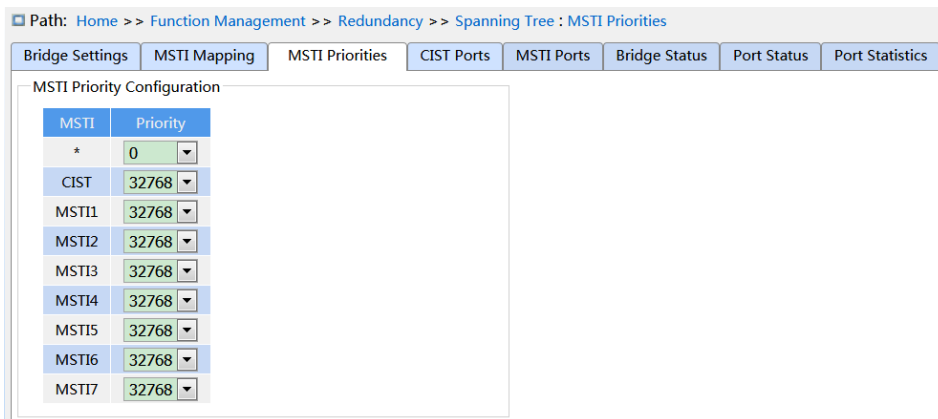

Figure 137 Configuring Bridge Priority in Designated Instance

Priority

Configuration range: 0~61440 with the step length of 4096

Default configuration: 32768

Function: Configure the bridge priority of the switch in designated instance.

Description: The bridge priority determines whether the switch can be elected to regional root of spanning tree instance. The smaller value is, the higher priority is. By setting a lower priority, a certain device can be designated to root bridge of spanning tree. The MSTP-enabled device can be configured with different priorities in different spanning tree instance.

Click <Apply> to make current configurations take effect.

4. Configure CIST ports, as shown below.

Path: Home >> Function Management >> Redundancy >> Spanning Tree : CIST Ports

Bridge Settings | MSTI Mapping | MSTI Priorities | CIST Ports | MSTI Ports | Bridge Status | Port Status | Port Statistics

Aggregated Port Configuration										
Port	STP Enable	Path Cost	Priority	Admin Edge	Auto Edge	Restricted		BPDU Guard	Point-to-point

11	<input type="checkbox"/>	Auto	128	Non-Edge	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Auto	
12	<input type="checkbox"/>	Auto	128	Non-Edge	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Auto	

Apply

Figure 138 Configure CIST Ports

STP Enabled

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable or disable STP/RSTP on ports.

Caution:

MSTP port and port channel are mutually exclusive. A MSTP port cannot be added to a port channel; a port in a port channel cannot be configured as a MSTP port.

Path Cost

Configuration options: Auto/Specific (1~200000000)

Default configuration: Auto

Description: The path cost of a port is used to calculate the best path. The value of the parameter depends on the bandwidth. The larger the value, the lower the cost. You can change the role of a port by changing the value of the path cost parameter. To configure the value manually, select No for Cost Count.

Priority

Configuration range: 0~240. The step is 16.

Default configuration: 128

Function: Configure the port priority, which determines the roles of ports.

Admin Edge

Configuration options: Non-Edge/Edge

Default configuration: Non-Edge

Function: Set whether the current port is an edge port.

Description: When a port is directly connected to a terminal and is not connected to other devices or a shared network segment, the port is considered as an edge port. An edge can rapidly migrate from the blocking state to the forwarding state without waiting delay. After an edge port receives BPDU packets, it becomes a non-edge port.

Auto Edge

Configuration options: Enable/Disable

Default configuration: Enable

Function: Whether to enable the automatic detection function of an edge port.

Restricted Role

Configuration options: Enable/Disable

Default configuration: Disable

Function: A restricted port will be never selected as a root node even if it is granted the highest priority.

Restricted TCN

Configuration options: Enable/Disable

Default configuration: Disable

Function: A port with restricted TCN will not actively send TCN messages.

BPDU Guard

Configuration options: Enable/Disable

Default configuration: Disable

Function: Control whether an edge port enters the Error-Disable state and is shut down when receiving BPDU packets.

Point-to-point

Configuration options: Auto/Forced True/Forced False

Default configuration: Auto

Function: Set the connection type for a port. If a port is connected to a point-to-point link, the port can rapidly migrate to another state.

Description: Auto indicates that the switch automatically detects the link type based on the duplex status of a port. When a port works in full-duplex mode, the switch considers that the type of the link connected to the port is point-to-point; when a port works in half-duplex mode, the switch considers that the type of the link connected to the port is shared. Forced point-to-point refers that a link connected to a port is a point-to-point link, and forced sharing refers that a link connected to a port is a shared link.

5. Configure MSTI ports, as shown below.

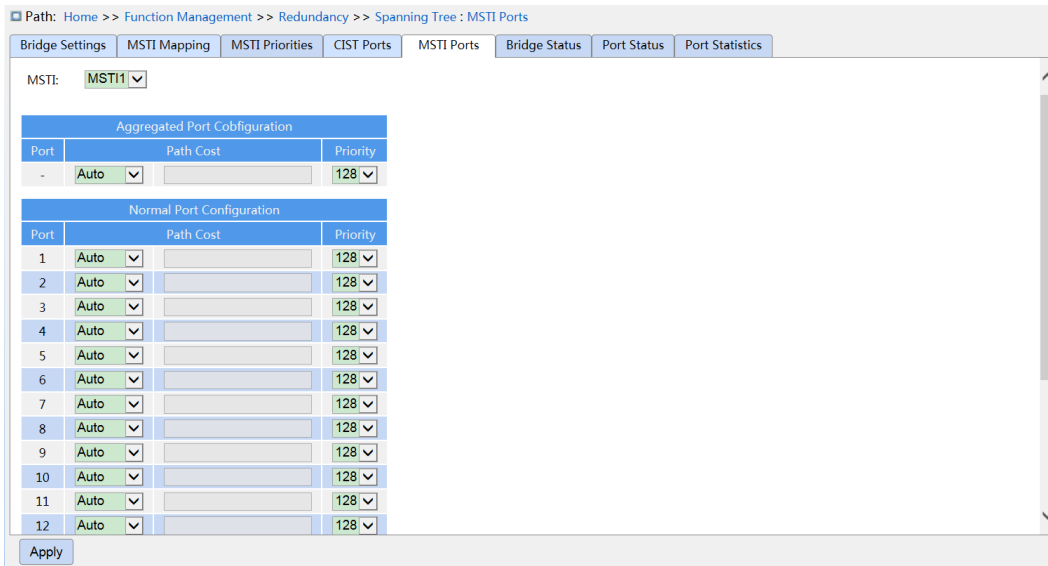

Figure 139 Select MSTI

Select MSTI

Configuration range: MST1~MST7

Default configuration: MST1

Function: Select a MSTI.

MSTI Aggregated Port Cobfiguration

Function: Configure the aggregation group as an MSTP port and configure its path cost and priority in the specified instance.

Path Cost

Configuration options: Auto/Specific (1~200000000)

Default configuration: Auto

Function: Configure the path cost of the port in the designated instance.

Description: Port path cost is used to calculate the optimum path. This parameter depends on bandwidth. The bigger bandwidth is, the lower cost is. Changing port path costs can change the transmission path between the device and root bridge, thereby changing port role. The MSTP-enabled port can be configured with different path costs in different spanning tree instances.

Priority

Configuration range: 0~240. The step is 16.

Default configuration: 128

Function: Configure the priority of the port in the designated instance.

Description: Port priority determines whether it will be elected to root port. In the same condition, the port with lower priority will be elected to root port. The MSTP-enabled ports can be configured with different priorities and play different port roles in different spanning tree instances.

Click the <Apply> button to make the current configuration take effect.

6. View bridge status, as shown below.

7.5.3.5 Typical Configuration Example

As shown in Figure 143, Switch A, B, C, and D belong to the same MST region. The VLANs marked in red indicate the VLAN packets can be transmitted through the links. After configurations are completed, VLAN packets can be forwarded along different spanning tree instances. VLAN 10 packets are forwarded along instance 1 and the root bridge of instance 1 is Switch A; VLAN 30 packets are forwarded along instance 3 and the root bridge of instance 3 is Switch B. VLAN 40 packets are forwarded along instance 4 and the root bridge of instance 4 is Switch C. VLAN 20 packets are forwarded along instance 0 and the root bridge of instance 0 is Switch B.

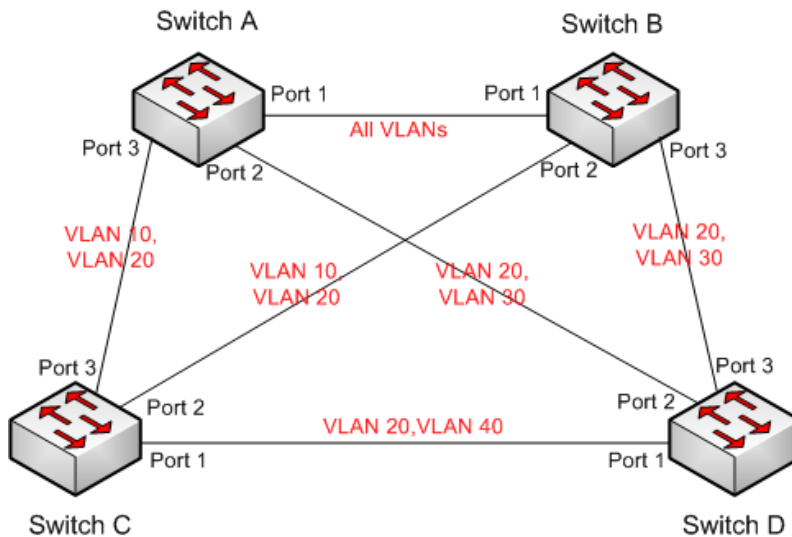

Figure 143 MSTP Typical Configuration Example

Configuration on Switch A:

1. Create VLAN 10, 20, and 30 on Switch A; set the ports and allow the packets of corresponding VLANs to pass through.
2. Enable global MSTP protocol, as shown in Figure 135.
3. Set the name of MST region to Region and the revision parameter to 0, as shown in Figure 139.
4. Create MSTI 1, 3, and 4 and map VLAN 10, 30, and 40 to instance 1, 3, and 4 respectively, as shown in Figure 139.
5. Set the switch bridge priority in MSTI 1 to 4096, and keep default priority in other instances, as shown in Figure 137.

Configuration on Switch B:

6. Create VLAN 10, 20, and 30 on Switch B; set the ports and allow the packets of corresponding VLANs to pass through.
7. Enable global MSTP protocol, as shown in Figure 135.
8. Set the name of MST region to Region and the revision parameter to 0, as shown in Figure 139.
9. Create MSTI 1, 3, and 4 and map VLAN 10, 30, and 40 to instance 1, 3, and 4 respectively, as shown in Figure 139.
10. Set switch bridge priority in MSTI 3 and MSTI 0 to 4096, and keep default priority in other instances, as shown in Figure 137.

Configuration on Switch C:

11. Create VLAN 10, 20, and 40 on Switch C; set the ports and allow the packets of corresponding VLANs to pass through.
12. Enable global MSTP protocol, as shown in Figure 135.
13. Set the name of MST region to Region and the revision parameter to 0, as shown in Figure 139.
14. Create MSTI 1, 3, and 4 and map VLAN 10, 30, and 40 to instance 1, 3, and 4 respectively, as shown in Figure 139.
15. Set switch bridge priority in MSTI 4 to 4096, and keep default priority in other instances, as shown in Figure 137.

Configuration on Switch D:

16. Create VLAN 20, 30, and 40 on Switch D; set the ports and allow the packets of corresponding VLANs to pass through.
17. Enable global MSTP protocol, as shown in Figure 135.
18. Set the name of MST region and the revision parameter to 0, as shown in Figure 139.
19. Create MSTI 1, 3, and 4 and map VLAN 10, 30, and 40 to instance 1, 3, and 4 respectively, as shown in Figure 139.

When MSTP calculation is completed, the MSTI of each VLAN is as follows:

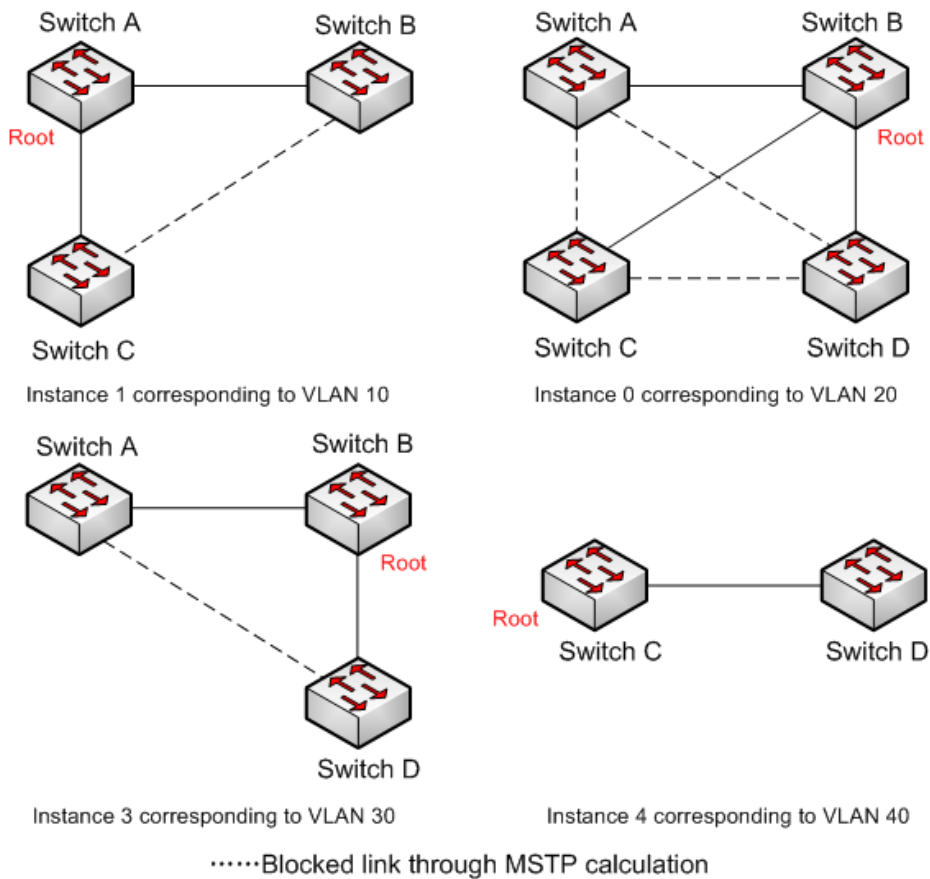

Figure 144 Spanning Tree Instance of each VLAN

7.5.4 DT-Ring

7.5.4.1 Introduction

DT-Ring and DT-Ring+ are Kyland-proprietary redundancy protocols. They enable a network to recover within 50ms when a link fails, ensuring stable and reliable communication.

DT rings fall into two types: port-based (DT-Ring-Port) and VLAN-based (DT-Ring-VLAN).

DT-Ring-Port: specifies a port to forward or block packets.

DT-Ring-VLAN: specifies a port to forward or block the packets of a specific VLAN. This allows multiple VLANs on a tangent port, that is, one port is part of different redundant rings based on different VLANs.

DT-Ring-Port and DT-Ring-VLAN cannot be used together.

7.5.4.2 Concepts

Master: One ring has only one master. The master sends DT-Ring protocol packets and detects the status of the ring. When the ring is closed, the two ring ports on the master are in forwarding and blocking state respectively.

**Note:**

The first port whose link status changes to up when the ring is closed is in forwarding state.
The other ring port is in blocking state.

Slave: A ring can include multiple slaves. Slaves listen to and forward DT-Ring protocol packets and report fault information to the master.

Backup port: The port for communication between DT rings is called the backup port.

Master backup port: When a ring has multiple backup ports, the backup port with the larger MAC address is the master backup port. It is in forwarding state.

Slave backup port: When a ring has multiple backup ports, all the backup ports except the master backup port are slave backup ports. They are in blocking state.

Forwarding state: If a port is in forwarding state, the port can both receive and send data.

Blocking state: If a port is in blocking state, the port can receive and forward only DT-Ring protocol packets, but not other packets.

7.5.4.3 Implementation

DT-Ring-Port Implementation

The forwarding port on the master periodically sends DT-Ring protocol packets to detect ring status. If the blocking port of the master receives the packets, the ring is closed; otherwise, the ring is open.

Working process of switch A, Switch B, Switch C, and Switch D:

1. Configure Switch A as the master and the other switches as slaves.
2. Ring port 1 on the master is in forwarding state while ring port 2 is in blocking state. Both two ports on the slave are in forwarding state.
3. If link CD is faulty, as shown in Figure 1.
 - a) When link CD is faulty, port 6 and port 7 on the slave are in blocking state. Port 2 on the master changes to forwarding state, ensuring normal link communication.
 - b) When the fault is rectified, port 6 and port 7 on the slave are in forwarding state. Port 2 on the master changes to blocking state. Link switchover occurs and links restore to the state before CD is faulty.

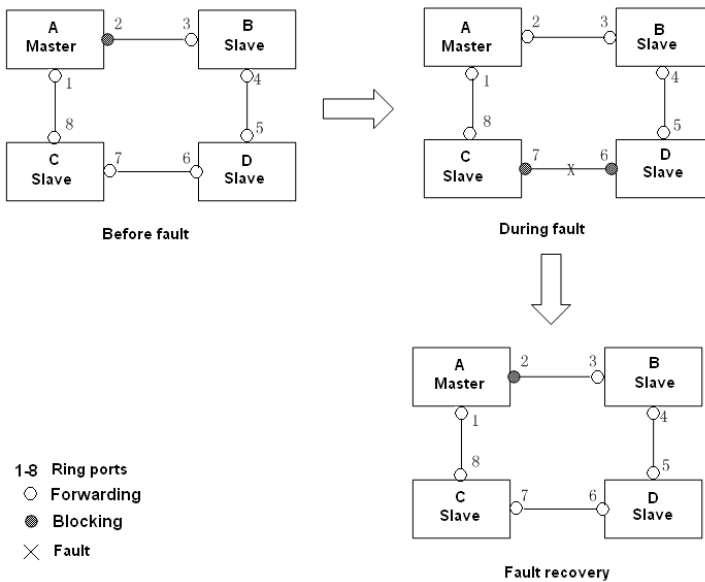

Figure 1 CD Link Fault

4. If link AC is faulty, as shown in Figure 2.

a) When link AC is faulty, port 1 is in blocking state and port 2 changes to forwarding state, ensuring normal link communication.

b) After the fault is rectified, port 1 is still in blocking state and port 8 is in forwarding state. No switchover occurs.

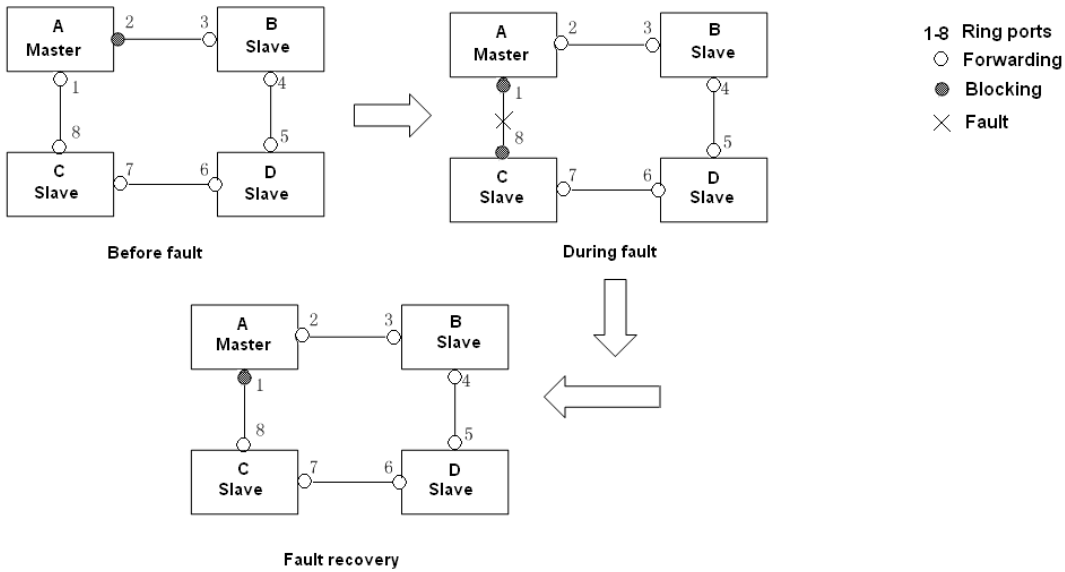

Figure 2 DT-Ring Link Fault

Caution:

Link status change affects the status of ring ports.

DT-Ring-VLAN Implementation

DT-Ring-VLAN allows the packets of different VLANs to be forwarded in different paths. Each forwarding path for a VLAN forms a DT-Ring-VLAN. Different DT-VLAN-Rings can have different masters. As shown in Figure 3, two DT-Ring-VLANs are configured.

Ring links of DT-Ring-VLAN 10: AB-BC-CD-DE-EA.

Ring links of DT-Ring-VLAN 20: FB-BC-CD-DE-EF.

The two rings are tangent at link BC, CD, and DE. Switch C and Switch D share the same ports in the two rings, but use different logical links based on VLANs.

Figure 3 DT-Ring-VLAN

Note:

In each DT-Ring-VLAN logical ring, the implementation is identical with that of DT-Ring-Port.

DT-Ring+ Implementation

DT-Ring+ can provide backup for two DT rings, as shown in Figure 4. One backup port is configured respectively on Switch C and Switch D. Which port is the master backup port depends on the MAC addresses of the two ports. If the master backup port or its link fails, the slave backup port will forward packets, preventing loops and ensuring normal communication between redundant rings.

Figure 4 DT-Ring+ Topology

Caution:

Link status change affects the status of backup ports.

7.5.4.4 Explanation

DT-Ring configurations should meet the following conditions:

- All switches in the same ring must have the same domain number.
- Each ring can only have one master and multiple slaves.
- Only two ports can be configured on each switch for a ring.
- For two connected rings, backup ports can be configured only in one ring.
- A maximum of two backup ports can be configured in one ring.
- On a switch, only one backup port can be configured for one ring.
- DT-Ring-Port and DT-Ring-VLAN cannot be configured on one switch at the same time.

7.5.4.5 Web Configuration

1. Configure DT-Ring redundant ring mode, as shown in Figure .

Figure 156 Redundant Ring Mode Configuration

Redundancy Mode

Options: Port Based/Vlan Based

Default: Port Based

Function: Choose DT-Ring redundant ring mode.

Caution:

- Port-based ring protocols include RSTP, DT-Ring-Port, and DRP-Port, and VLAN-based ring protocols include MSTP, DT-Ring-VLAN, and DRP-VLAN.
- VLAN-based ring protocols are mutually exclusive, and only type of VLAN-based ring protocol can be configured for one device.
- Port-based ring protocol and VLAN-based ring protocol are mutually exclusive, and only one

ring protocol mode can be selected for one device.

2. Configure DT-Ring-Port and DT-Ring-VLAN, as shown in Figure 5 and Figure 6.

Figure 5 DT-Ring-Port Configuration

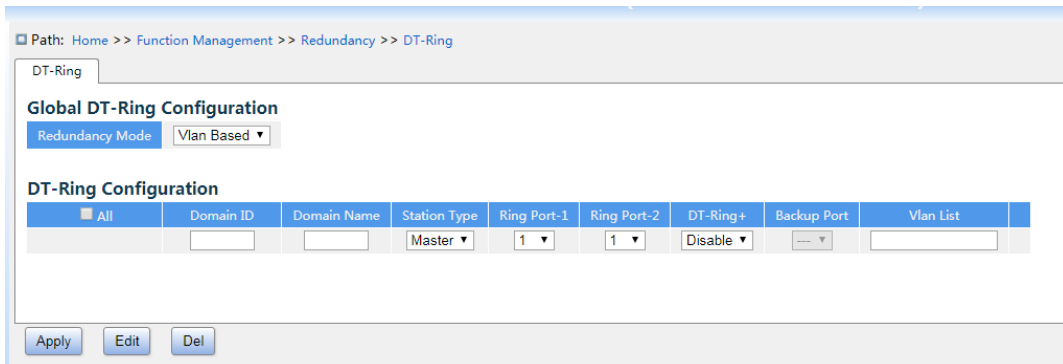

Figure 6 DT-Ring-VLAN Configuration

Domain ID

Range: 1~32

Function: The domain ID is used to distinguish different rings. One switch supports a maximum of 16 VLAN-based rings, the number of port-based rings depends on the number of switch ports.

Domain Name

Range: 1~31 characters

Function: Configure the domain name.

Station Type

Options: Master/Slave

Default: Master

Function: Select the switch role in a ring.

Ring Port-1/Ring Port-2

Options: all switch ports

Function: Select two ring ports.

Caution:

- DT-Ring ring port or backup port and port channel are mutually exclusive. A DT-Ring ring port or backup port cannot be added to a port channel; a port in a port channel cannot be configured as a DT-Ring ring port or backup port.
- Ring ports between port-based ring protocols RSTP, DT-Ring-Port, and DRP-Port are mutually exclusive, that is, the ring port and backup port of DT-Ring-Port cannot be configured as RSTP port, DRP-Port ring port, or DRP-Port backup port; RSTP port, DRP-Port ring port, and DRP-Port backup port cannot be configured as DT-Ring-Port ring port or backup port.
- It is not recommended that ports in the isolation group are configured as DT-Ring ports and backup ports at the same time, and DT-Ring ports and backup ports cannot be added to the isolation group.

DT-Ring+

Options: Enable/Disable

Default: Disable

Function: Enable/disable DT-Ring+.

Backup Port

Options: all switch ports

Function: Set a port to backup port.

Explanation: Enable DT-Ring+ before setting backup port.

Caution:

Do not configure a ring port as a backup port.

VLAN List

Options: all created VLANs

Function: Select the VLANs for the ring port. When there are multiple VLANs, you can separate the VLANs by a comma (,) and an en dash (-), where an en dash is used to separate two consecutive VLAN IDs and a comma is used to separate two inconsecutive VLAN IDs.

3. View and modify DT-Ring configuration, as shown in Figure 7.

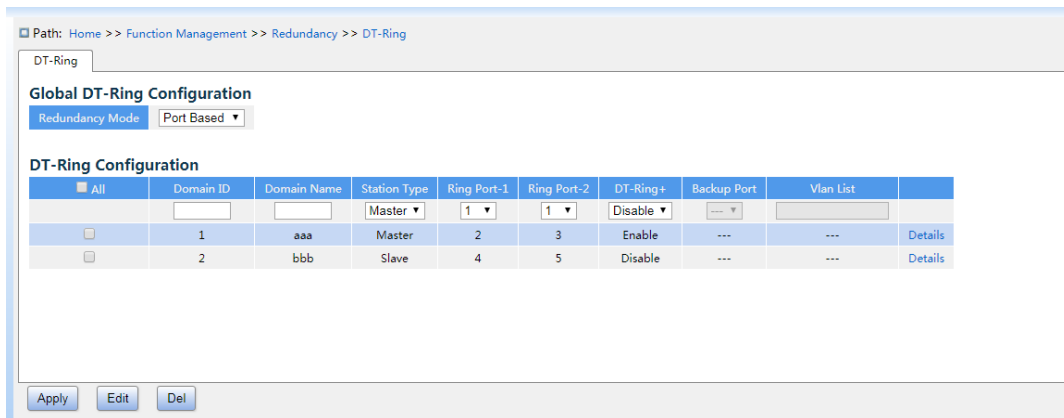

Figure 7 DT-Ring Configuration

Select a DT-Ring entry, click <Modify> to edit the DT-Ring entry configuration; click <Delete> to delete the designated DT-Ring entry.

4. Click a DT-Ring entry in Figure 7 to show DT-Ring and port status, as shown in Figure 8.

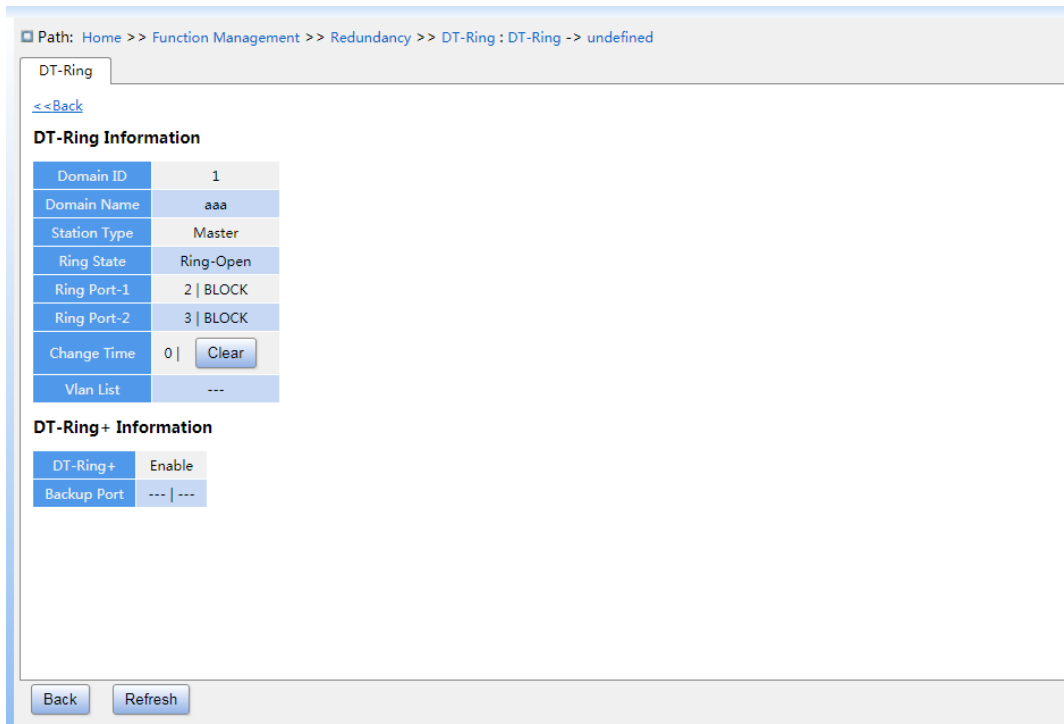

Figure 8 DT-Ring State

7.5.4.6 Typical Configuration Example

As shown in Figure 4, switch A, B, C, and D form Ring 1; Switch E, F, G, and H form ring 2. Links CE and DF are the backup links between Ring 1 and Ring 2.

Configuration on Switch A:

1. Configure domain ID to 1, domain name to a, ring port to 1, 2, station type to slave, DT-Ring+ to disable, do not set backup port, as shown in Figure 5.

Configuration on Switch B:

2. Configure domain ID to 1, domain name to a, ring port to 1, 2, station type to master, DT-Ring+ to disable, do not set backup port, as shown in Figure 5;

Configuration on Switch C and Switch D:

3. Configure domain ID to 1, domain name to a, ring port to 1, 2, station type to slave, DT-Ring+ to enable, backup port to 3, as shown in Figure 5;

Configuration on Switch E, Switch F, and Switch G:

4. Configure domain ID to 2, domain name to b, ring port to 1, 2, station type to slave, DT-Ring+ to disable, do not set backup port, as shown in Figure 5;

Configuration on Switch H:

5. Configure domain ID to 2, domain name to b, ring port to 1, 2, station type to master, DT-Ring+ to disable, do not set backup port, as shown in Figure 5;

7.6 ARP Configuration

7.6.1 Introduction

The Address Resolution Protocol (ARP) resolves the mapping between IP addresses and MAC addresses by the address request and response mechanism. The switch can learn the mapping between IP addresses and MAC addresses of other hosts on the same network segment. It also supports static ARP entries for specifying mapping between IP addresses and MAC addresses. Dynamic ARP entries periodically age out, ensuring consistency between ARP entries and actual applications.

This series switches provide not only Layer 2 switching function, but also the ARP function for resolving the IP addresses of other hosts on the same network segment, enabling the communication between the NMS and managed hosts.

7.6.2 Description

The ARP table items is divided into dynamic ARP table items and static ARP table items. Dynamic table items are generated and maintained automatically through ARP message interaction, which can be aged, updated by new ARP messages and overwritten by static ARP table items.

Static table items are manually configured and maintained and are not aged or overwritten by dynamic ARP table items.

7.6.3 Proxy ARP

If the ARP request is sent from the host of one network to another host on the same network segment but not on the same physical network, then the gateway with proxy ARP function

that directly connected to the source host can reply to the request message, which is called the proxy ARP.

The process of proxy ARP is as follows:

- 1、 The source host sends a ARP request to the host of another physical network;
- 2、 The gateway directly connected to the source host has enabled the proxy ARP function of the VLAN interface. If there is a normal route to the destination host, the destination host will be replaced to replay mac address of its own interface.
- 3、 The IP messages which is sent by the source host to the destination host are sent to the enabled proxy ARP device.
- 4、 Gateway performs normal IP routing forwarding of messages.
- 5、 IP messages that sent to the destination host reach the destination host through the network.

7.6.4 Web Configuration

1. Configure the static ARP address table items, as shown below.

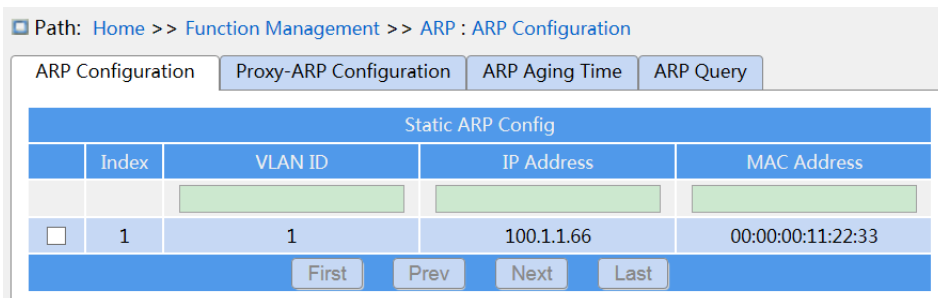

Figure 145 Configure static ARP table items

VLAN ID

Configuration content: Created L3 VLAN interface, range 1-4094

Function: select the L3 VLAN interface of the current ARP table item.

IP address

Configuration format: A.B.C.D

Function: configure IP addresses for static ARP table items.

MAC address

Configuration format: HH-HH-HH-HH-HH-HH (H is a hexadecimal number)

Function: configure the mac address of the static ARP table items.

Caution:

In general, the switch automatically learns ARP table items, and no need administrator configure static table items.

2. Proxy ARP Configuration, as shown below.

Figure 146 Proxy ARP Configuration

VLAN ID

Configuration range: 1-4094

Function: Select L3 interface of enabled proxy ARP.

3. ARP Aging Time Configuration, as shown below.

Figure 147 ARP Aging Time Configuration

VLAN ID

Configuration range: 1-4094

Function: specify the L3 interface with configuring ARP aging time

ARP Aging Time

Configuration range: 1 ~ 60min

Default configuration: 5min

Function: configure ARP aging time

Description: ARP aging time refers to start timing by adding a dynamic ARP table item to the address table, and the dynamic address table item will be deleted from the ARP list after the aging time is up.

4. ARP Query, as shown below.

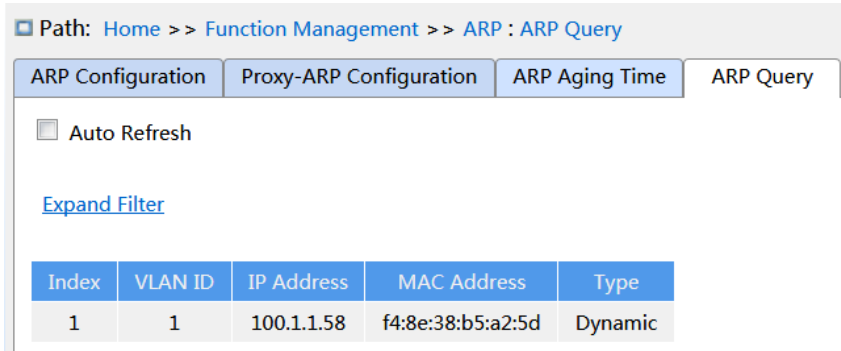

Figure 148 ARP Query

ARP Query

Display item: {index, VLAN ID, IP address, MAC address, type}

Function: display ARP table item

Description: The list displays all ARP table items corresponding to the linkup status port, includes static and dynamic table items.

7.7 ACL Configuration

7.7.1 Overview

With the development of network technologies, security issues have become increasingly prominent, calling for access control mechanism. With the Access Control List (ACL) function, the switch matches packets with the list to implement access control.

7.7.2 Implementation

The series switches filter packets according to the matched ACL. Each entry consists several conditions in the logical AND relationship. ACL entries are independent of each other.

The switch compares a packet with ACL entries in the ascending order of entry IDs. Once a

match is found, the action is taken and no further comparison is conducted, as shown in the following figure.

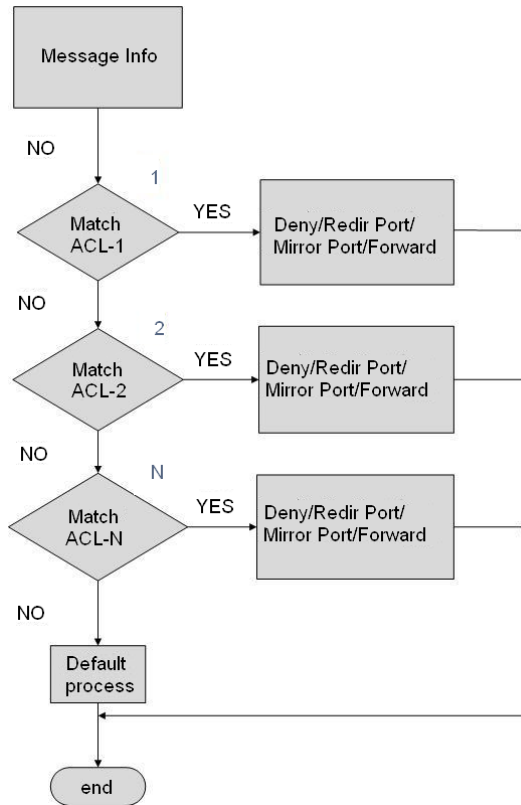

Figure 149 ACL Processing Flowchart

Note:

Default process indicates the processing mode towards packets matching no ACL entry.

7.7.3 Web Configuration

1. ACL Rate Limiters Configuration, as shown below.

Path: Home >> Function Management >> ACL : Rate Limiters

Figure 150 ACL Rate Limiters Configuration

Rate Unit

Configuration range: 0~5000000 pps(step 10)/ 0~10000000Kbps(step 25)

Default configuration: 10 pps

Function: configure the limit rate corresponding to the rate limit ID.

2. Configure ACL table item, as shown below.

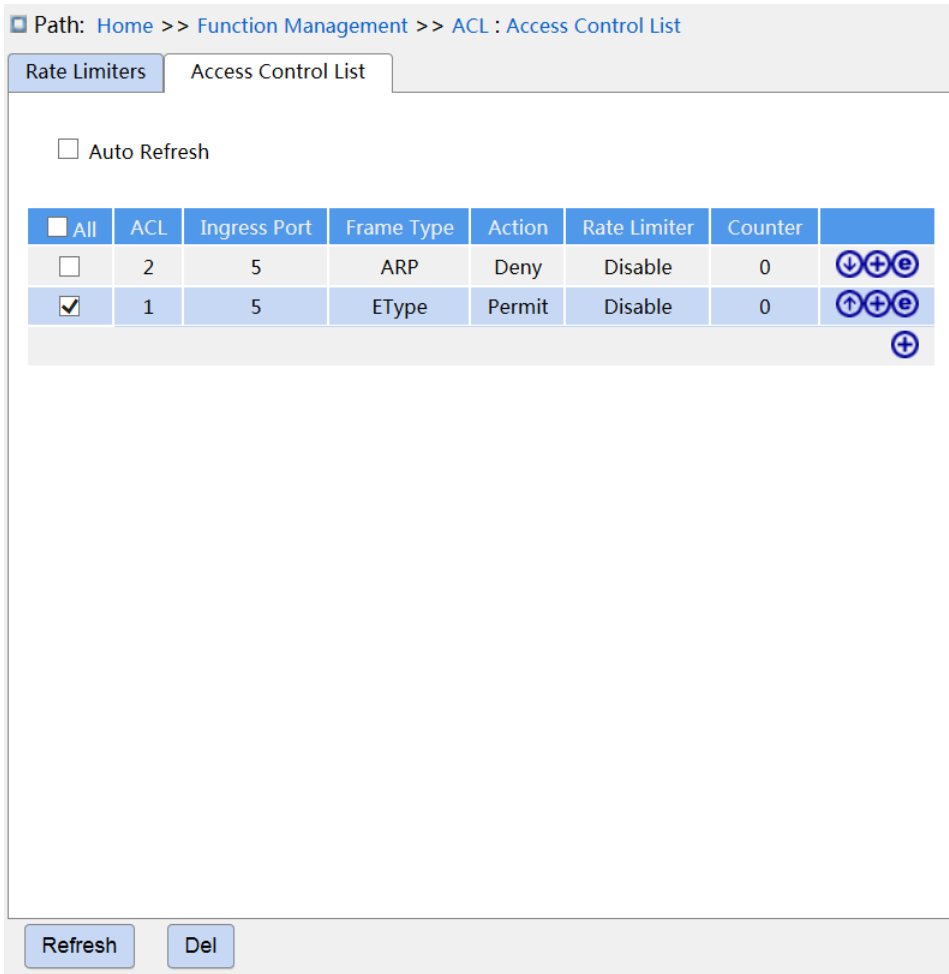

Figure 151 Configure ACL table item

When multiple ACL table items exist, the device compares messages to ACL table items one by one (in top to bottom order), once the message find a matching first ACL table item, Perform the corresponding action immediately.

Click<⬆️⬆️Ⓜ️>button, create an ACL table item. Click<Ⓜ️> button, edit current table item.

Click<⬆️> button, move up current table item. Click<⬇️> button, move down current table

item. Click <Ⓜ️>, then click the <Delete> button, delete current table item.

3、Configure the rule of ACL table item

- Configure parameters of ACL table item, as shown below.

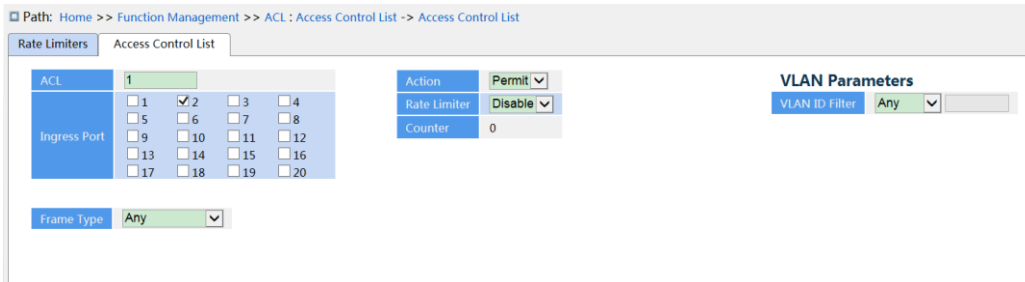

Figure 152 Configure parameters of ACL table item

ACL

Configuration range: 1-512

Function: configure ACL table item ID.

Ingress port

Configuration options: any specified port

Function: select the port of this item ACL.

Frame type

Configuration options: Any/Ethernet Type/IPv4/ARP

Default configuration: Any

Function: configure ACL conditional parameter - frame type. The condition matches successfully when the frame type received by the ingress port meets the parameter configuration.

Action

Configuration options: Deny/Permit

Default configuration: Permit

Function: the processing method of port matching ACL table item frame. Deny: discard the frame of matching ACL table item. Permit: forward the frame of matching ACL table item.

Rate limiter

Configuration range: Disable/1~16

Default configuration: Disable

Function: Enable or disable the port rate limiter, and select rate limiter ID.

Counter

Function: count the number of frames received by the ingress port that match the ACL.

VLAN ID filter

Configuration options: Any/ Specific (1~4094)

Default configuration: Any

Function: Configure condition parameterc—VID, when selecting “Specific”, need to configure VID value. When the VID of received frame from ingress port satisfies the configured parameter, the condition matches successfully.

➤ Configure Ethernet Type frame parameters, as shown below.

Figure 153 Configure EtherType frame parameters

SMAC filter

Configuration options: Any/ Specific

Default configuration: Any

Function: configure conditional parameter-source MAC address, if select “specific”, need to configure a source MAC address. When the source MAC address of received frame from ingress port satisfies the configured parameter, the condition matches successfully.

DMAC Filter

Configuration options: Any/ Specific

Default configuration: Any

Function: configure conditional parameter-destination MAC address, if select “specific”, need to configure a destination MAC address. When the destination MAC address of received frame from ingress port satisfies the configured parameter, the condition matches successfully.

Ether Type Filter

Configuration options: Any/ Specific (0x600~0xFFFF)

Default configuration: Any

Function: configure conditional parameter-ethernet type, if select “specific”, need to

configure ethernet type. When the received ethernet frame from ingress port satisfies the configured parameter, the condition matches successfully.

➤Configure ARP frame parameters, as shown below.

MAC Parameters		Ethernet Type Parameters	
SMAC Filter	Specific	EtherType Filter	Any
SMAC Value	02-02-02-02-02-02		
DMAC Filter	Any		

Figure 154 Configure ARP Parameters

SMAC Filter

Configuration options: Any/ Specific

Default configuration: Any

Function: configure conditional parameter-source MAC address, if select “specific”, need to configure a source MAC address. When the source MAC address of received frame from ingress port satisfies the configured parameter, the condition matches successfully.

ARP/RARP

Configuration options: Any/ ARP/RARP

Default configuration: Any

Function: configure conditional parameter-frame type, when the received frame type from ingress port satisfies the configured parameter, the condition matches successfully.

Source IP Filter

Configuration options: Any/Host/Network

Default configuration: Any

Function: configure conditional parameter-source IP address, if select “Host”, need to configure an IP address. if select “Network”, need to configure an IP address and mask. When the source IP address of received frame from ingress port satisfies the configured parameter, the condition matches successfully.

Destination IP Filter

Configuration options: Any/Host/Network

Default configuration: Any

Function: configure conditional parameter-destination IP address, if select “Host”, need to

configure an IP address. if select “Network”, need to configure an IP address and mask. When the destination IP address of received frame from ingress port satisfies the configured parameter, the condition matches successfully.

➤ Configure IPv4 frame parameters, as shown below.

Figure 155 Configure IPv4 frame parameters

IP Protocol Filter

Configuration options: Any/ ICMP/ UDP/ TCP/ Other (0~255)

Default configuration: Any

Function: configure conditional parameter- IPv4 frame protocol type, if select “ICMP/ UDP/ TCP”, need to configure the corresponding parameters. if select “Other”, need to configure protocol number. When the protocol type of received IPv4 frame from ingress port satisfies the configured parameter, the condition matches successfully.

SIP Filter

Configuration options: Any/Host/Network

Default configuration: Any

Function: configure conditional parameter-source IP address, if select “Host”, need to configure an IP address. if select “Network”, need to configure an IP address and mask. When the source IP address of received IPv4 frame from ingress port satisfies the configured parameter, the condition matches successfully.

DIP Filter

Configuration options: Any/Host/Network

Default configuration: Any

Function: configure conditional parameter-destination IP address, if select “Host”, need to configure an IP address. if select “Network”, need to configure an IP address and mask. When the destination IP address of received IPv4 rame from ingress port satisfies the configured parameter, the condition matches successfully.

➤ Configure ICMP Parameters, as shown below.

Figure 156 Configure ICMP Parameters

ICMP Type Filter

Configuration options: Any/Specific (0~255)

Default configuration: Any

Function: configure conditional parameter-ICMP type value, if select "Specific", need to configure an ICMP type value. When the ICMP type value of received IPv4 rame from impress port satisfies the configured parameter, the condition matches successfully.

ICMP Code Filter

Configuration options: Any/Specific (0~255)

Default configuration: Any

Function: configure conditional parameter-ICMP code value, if select "Specific", need to configure an ICMP code value. When the ICMP code value of received IPv4 rame from impress port satisfies the configured parameter, the condition matches successfully.

➤ Configure UDP Parameters, as shown below.

Figure 157 Configre UDP Parameters

Source Port Filter/ Destination Port Filter

Configuration options: Any/ Range (0~65535)

Default configuration: Any

Function: configure conditional parameter-UDP source and destination port number, if select "Range", need to configure the range of port number. When the UDP port number of received IPv4 rame from impress port satisfies the configured parameter, the condition matches successfully.

➤ Configure TCP Parameters, as shown below.

Figure 158 Configure TCP Parameters

Source Port Filter/ Destination Port Filter

Configuration options: Any/ Range (0~65535)

Default configuration: Any

Function: configure conditional parameter-TCP source and destination port number, if select "Range", need to configure the range of port number. When the TCP port number of received IPv4 rame from impress port satisfies the configured parameter, the condition matches successfully.

7.7.4 Typical Configuration Example

Connect port 2 of the switch. Configure the port to receive packets only from source MAC address 02-02-02-02-02-02 and forward the packets through port 1.

Configuration steps:

1. Create ACL1, set ingress port to 2, action to Permit, as shown in Figure 152.
2. Configure ACL1 entry, frame type to Ethernet Type, as shown in Figure 153.
3. Configure ACL1 entry, parameters of Ethernet Type, Set SMAC filter to 02-02-02-02-02-02, as shown in Figure 153.
4. Create ACL, set ingress port to 2, action to Deny, as shown in Figure 152.
5. Keep all the other parameters default or empty.

7.8 MAC Address Configuration

7.8.1 Introduction

When forwarding a packet, the switch searches for the forwarding port in the MAC address table based on the destination MAC address of the packet.

A MAC address can be either static or dynamic.

A static MAC address is configured by a user. It has the highest priority (not overridden by dynamic MAC addresses) and is permanently valid.

Dynamic MAC addresses are learned by the switch in data forwarding. They are valid only for a certain period. The switch periodically updates its MAC address table. When receiving a data frame to be forwarded, the switch learns the source MAC address of the frame, establishes a mapping with the receiving port, and queries the forwarding port in the MAC address table based on the destination MAC address of the frame. If a match is found, the switch forwards the data frame from the corresponding port. If no match is found, the switch broadcasts the frame in its broadcast domain.

Aging time starts from when a dynamic MAC address is added to the MAC address table. If no port receives a frame with the MAC address within one to two times the aging time, the switch deletes the entry of the MAC address from the dynamic forwarding address table.

Static MAC addresses do not involve the concept of aging time.

7.8.2 Web Configuration

1. Configure MAC address aging time, as shown below.

Figure 159 MAC Address Aging Time Configuration

Aging Time

Configuration range: 0 or 10~1000000s

Default configuration: 300s

Function: Set the aging time for the dynamic MAC address entry.

2. Configure static MAC address table items, as shown below.

Figure 160 Configure Static MAC Address table items

VLAN ID

Configuration options: all created VLAN IDs

Default configuration: VLAN 1

Function: Configuration the VLAN ID of static MAC address.

MAC address

Format: HH-HH-HH-HH-HH-HH (H is a hexadecimal number)

Function: Configure MAC address. For unicast MAC address, the lowest bit in the first byte is 0. For multicast MAC address, the lowest bit in the first byte is 1.

Port Members

Function: Select ports to forward the packets with this destination MAC address.

Click <Add New Static Entry> to configure static MAC address entry. A maximum of 64 static MAC address entries are supported.

3. View MAC address table, as shown below.

Path: Home >> Function Management >> MAC Table : Query

7.9 IGMP Snooping

7.9.1 Introduction

Internet Group Management Protocol Snooping (IGMP Snooping) is a multicast protocol at the data link layer. It is used for managing and controlling multicast groups. IGMP Snooping-enabled switches analyze received IGMP packets, establish mapping between ports and MAC multicast addresses, and forward multicast packets according to the mapping.

There are three versions of the Internet Group Message Protocol (IGMP): IGMPv1, IGMPv2, and IGMPv3. IGMPv1 is defined in RFC1112, IGMPv2 is defined RFC2236, and IGMPv3 is defined in RFC3376.

IGMPv1 supports two types of packets (report and query packets) and defines the basic group member query and report process.

IGMPv2, on the basis of IGMPv1, provides the leave packet of the fast leave mechanism for group members. With this mechanism, when the last member leaves a multicast group, the router is instructed to conduct fast convergence. In comparison with IGMPv1, IGMPv2 supports two types of query packets: general query packet and group-specific query packet. The switch periodically sends a general query packet to query the membership. When a host leaves a multicast group, after the switch receives a leave message, the switch sends a group-specific query packet to determine whether all members leave the multicast group.

The host source filtering function is added to IGMPv3. This function enables a host to specify whether to receive or reject packets from some specific multicast group sources.

7.9.2 Basic Concepts

Querier: periodically sends IGMP general query packets to query the status of the members in the multicast group, maintaining the multicast group information. When multiple queriers exist on a network, they automatically elect the one with the smallest IP address to be the querier. Only the elected querier periodically sends IGMP general query packets. The other queriers only receive and forward IGMP query packets.

Router port: receives general query packets (on an IGMP-enabled switch) from the querier. Upon receiving an IGMP report, a switch establishes a multicast entry and adds the port that receives the IGMP report to the member port list. If a router port exists, it is also added to the member port list. Then the switch forwards the IGMP report to other devices through the router port, so that the other devices establish the same multicast entry.

IGMP snooping proxy: The IGMP snooping proxy function is configured on an edge device to reduce the number of IGMP report packets and leave packets received by an upstream device, thereby improving the overall performance of the upstream device. A device on which the IGMP snooping proxy function is configured functions as a host of its upstream device, and functions as a querier of its downstream host.

7.9.3 Principle

IGMP Snooping manages and maintains multicast group members by exchanging related packets among IGMP-enabled devices. The related packets are as follows:

General query packet: The querier periodically sends general query packets (destination IP address: 224.0.0.1) to confirm whether the multicast group has member ports. After receiving the query packet, a non-querier device forwards the packet to all its connected ports.

Specific query packet: If a device wants to leave a multicast group, it sends an IGMP leave packet. After receiving the leave packet, the querier sends a specific query packet (destination IP address: IP address of the multicast group) to confirm whether the group contains other member ports.

Membership report packet: If a device wants to receive the data of a multicast group, the

device sends an IGMP report packet (destination IP address: IP address of the multicast group) immediately to respond to the IGMP query packet of the group.

Leave packet: If a device wants to leave a multicast group, the device will send an IGMP leave packet (destination IP address: 224.0.0.2).

7.9.4 Web Configuration

1. Enable IGMP Snooping, as shown below.

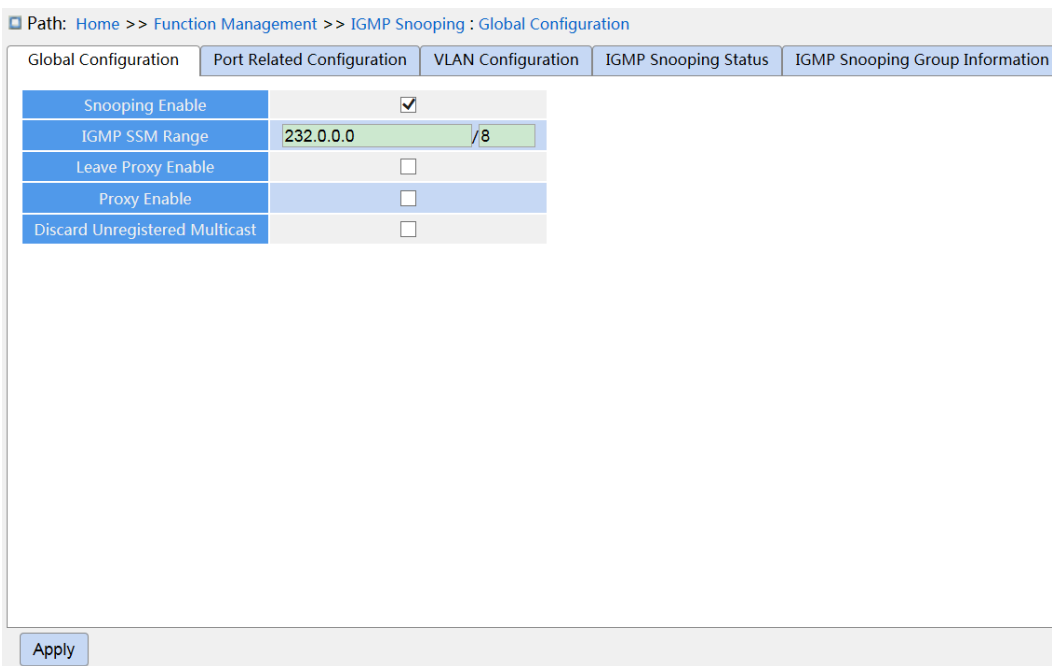

Figure 162 Configure IGMP Snooping

Snooping Enabled

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable or disable the global IGMP Snooping protocol.

IGMP SSM Range

Configuration Format: A.B.C.D/ 4~32

Default configuration: 232.0.0.0/8

Function: Only hosts and routers with the address within the value of this parameter can run

the service model of IGMP source specific multicast (SSM) provided that the hosts and routers support the IGMP SSM service model. The SSM service model provides users with a transmission service of specifying multicast sources for a client.

Leave Proxy Enabled

Configuration options: Enabled/Disabled

Default configuration: Disabled

Function: Specify whether to forward leave packets to the querier. When it is enabled, leave packets are not forwarded.

Proxy Enabled

Configuration options: Enabled/Disabled

Default configuration: Disabled

Function: Specify whether to forward leave packets and member report packets to the querier. When it is enabled, leave packets and member report packets are not forwarded.

Discard Unregistered Multicast

Configuration options: Enabled/Disabled

Default configuration: Disabled

Function: Whether the switch discards when it receives unknown multicast packets.

2. Configure IGMP port, as shown below.

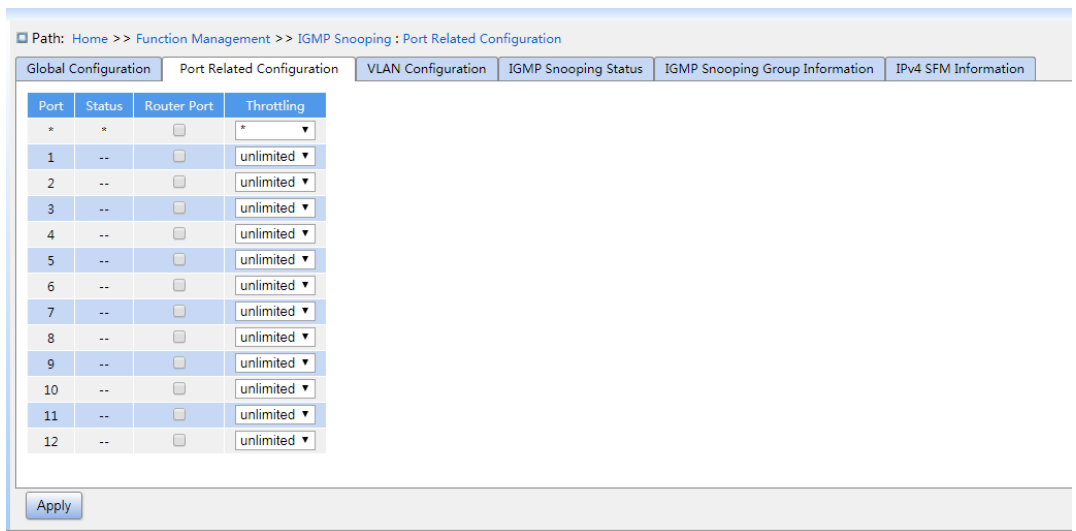

Figure 163 Configure IGMP Port

Status

Configuration options: --/static/dynamic/both

Function: Displays the router port status. **static** indicates that the port is statically configured as a routed port; **dynamic** indicates that the port is dynamically learned as a routed port. **Both** indicates that the port is dynamically configured as a routing port and dynamically learns to route the port.

Router Port

Configuration options: Enabled/Disabled

Default configuration: Disabled

Function: Configure router port.

Throttling

Configuration options: unlimited/1~10

Default configuration: unlimited

Function: Whether to limit the number of multicast entries learnt by a port.

3. Configure IGMP Snooping VLAN, as shown below.

AS	VLAN Interface	Snooping Enable	Querier Election	Querier Address	Compatibility	PRI	BV	QI(sec)	ORI(0.1sec)	LLQI(0.1sec)	URI(sec)
<input type="checkbox"/>	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	0.0.0.0	<input checked="" type="radio"/> Forced IGMPv1 <input type="radio"/> Forced IGMPv2 <input type="radio"/> Forced IGMPv3 IGMPv2	0	2	125	100	10	1

Figure 164 Configure IGMP Snooping VLAN

VLAN Interface

Configuration options: all created VLAN IDs

Snooping Enabled

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable or disable the VLAN IGMP Snooping function. The precondition of this function is to enable global IGMP Snooping function.

Querier Election

Configuration options: Enable/Disable

Default configuration: Enable

Function: Enable or disable the IGMP query function for the selected VLAN. The precondition of this function is to enable global IGMP Snooping function and the VLAN IGMP Snooping function.

Description: If there are multiple queriers in network, they will automatically select the one with the smallest IP address to be the querier. If there is only one device which enables IGMP query function, it will be the querier.

Querier Address

Configuration Format: A.B.C.D

Function: Configure the source IP address of sending the query packet. When set as 0.0.0.0, the IP address of the VLAN port is used as the querier address.

Compatibility

Configuration options: Forced IGMPv1/Forced IGMPv2/Forced IGMPv3

Default configuration: Forced IGMPv2

Function: Configure IGMP version.

PRI (Priority of Interface)

Configuration range: 0~7

Default configuration: 0

Function: Configure the priority of IGMP control packet.

RV (Robustness Variable)

Configuration range: 1~255

Default configuration: 2

Function: Specify the robustness parameter of the IGMP query function.

Description: The larger the parameter, the worse the network environment. User can set a suitable robustness parameter according to the actual network.

QI (Query Interval)

Configuration range: 1~31744s

Default configuration: 125s

Function: Configure the interval of sending general query packet.

QRI (Query Response Interval)

Configuration range: 0~31744 (unit: 0.1s)

Default configuration: 100

Function: Configure the max response time of responding general query packet.

LLQI (Last Member Query Interval)

Configuration range: 0~31744 (unit: 0.1s)

Default configuration: 10

Function: Configure the max response time of responding specific query packet.

Caution:

QI, QRI, and LLQI configuration is valid only for querier.

URI (Unsolicited Report Interval)

Configuration range: 0~31744s

Default configuration: 1s

Function: Set the interval for a host to re-send a report packet for joining a multicast group

Click <Add New IGMP VLAN> to configure IGMP Snooping VLAN entry. A maximum of 32 IGMP Snooping VLAN entries are supported.

4. View IGMP Snooping status, as shown below.

Path: Home >> Function Management >> IGMP Snooping: IGMP Snooping Status

7.9.5 Typical Application Example

As shown in Figure 168, enable IGMP Snooping function in Switch 1, Switch 2, and Switch 3. Enable auto query on Switch 2 and Switch 3. The IP address of Switch 2 is 192.168.1.2 and that of Switch 3 is 192.168.0.2, so Switch 3 is elected to querier.

1. Enable IGMP Snooping.
2. Enable IGMP Snooping and auto-query.
3. Enable IGMP Snooping and auto-query.

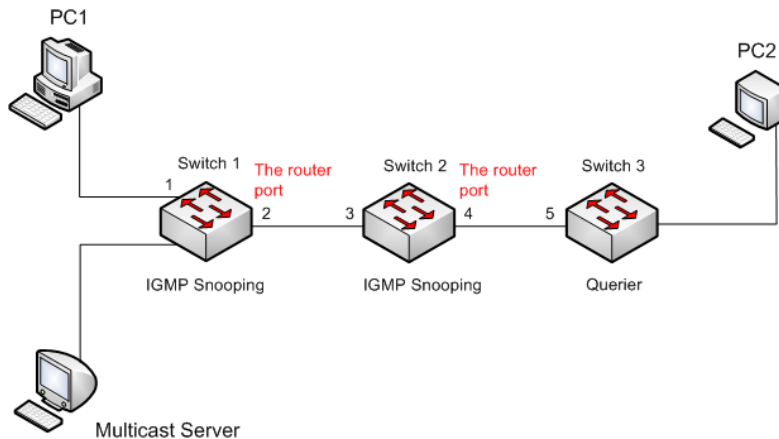

Figure 168 IGMP Snooping Application Example

- Because Switch 3 is elected as the querier, it periodically sends out a general query message.
- Port 4 of Switch 2 receives query message. It becomes router port. Meanwhile, Switch 2 forwards query message from port 3. Then port 2 of Switch 1 is elected to router port once it receives query message from Switch 2.
- When PC 1 joins in multicast group 225.1.1.1, it will send out IGMP report message, so port 1 and router port 2 of Switch 1 will also join in multicast group 225.1.1.1. Then, the IGMP report message will be forwarded to Switch 2 by router port 2, so port 3 and port 4 of Switch 2 will also join in 225.1.1.1, and then the IGMP report message will be forwarded to Switch 3 by router port 4, so port 5 of Switch 3 will join in 225.1.1.1 as well.
- When multicast server's multicast data reaches Switch 1, the data will be forwarded to PC1 by port 1; because router port 2 is also a multicast group member, so the multicast data will be forwarded by router port. In this way, when the data reaches port 5 of Switch 3, it will stop forwarding because there is no receiver any more, but if PC2 also joins in group 255.1.1.1, the multicast data will be forwarded to PC2.

7.10 DHCP Configuration

With the continuous expansion of network scale and the growing of network complexity, under the conditions of the frequent movement of computers (such as laptops or wireless network) and the computers outnumbering the allocable IP addresses, the BootP protocol that is specially for the static host configuration has become increasingly unable to meet actual needs. For fast access and exit network and improving the utilization ratio of IP address resources, we do need to develop an automatic mechanism based on BootP to assign IP addresses. DHCP (Dynamic Host Configuration Protocol) was introduced to solve these problems.

DHCP employs a client-server communication model. The client sends a configuration request to the server, and then the server replies configuration parameters such as an IP address to the client, achieving the dynamic configuration of IP addresses. The structure of a DHCP typical application is shown in Figure 169.

Figure 169 DHCP Typical Application

Caution:

In the process of dynamic obtainment of IP addresses, the messages are transmitted in the way of broadcast, so it is required that the DHCP client and the DHCP server are in a same segment. If they are in the different segments, the client can communicate with the server via a DHCP relay to get IP addresses and other configuration parameters.

DHCP supports two types of IP address allocation mechanisms.

Static allocation: the network administrator statically binds fixed IP addresses to few specific clients such as a WWW server and sends the binding IP addresses to clients by DHCP. The tenancy term for static allocation is permanent.

Dynamic allocation: DHCP server dynamically allocates an IP address to a client. This allocation mechanism can allocate a permanent IP address or an IP address with a limited lease period to a client. When the lease expires, the client needs to reapply an IP address.

The network administrator can choose a DHCP allocation mechanism for each client.

7.10.1 DHCP Server Configuration

7.10.1.1 Introduction

DHCP server is a provider of DHCP services. It uses DHCP messages to communicate with DHCP client to allocate a suitable IP address to the client and assign other network parameters to the client as required. In the following conditions, the DHCP server generally is used to allocate IP addresses.

- Large network scale. The workload of manual configuration is heavy and it is hard to manage the entire network.
- The hosts outnumber the assignable IP addresses, and it is unable to allocate a fixed IP address to each host.

Only a few hosts in the network need fixed IP addresses.

7.10.1.2 DHCP Address Pool

The DHCP server selects an IP address from an address pool and allocates it together with other parameters to the client. The IP address allocation sequence is as follows:

1. The IP address statically bound to the client MAC address.
2. The IP address that is recorded in the DHCP server that it was ever allocated to the client.
3. The IP address that is specified in the request message sent from the client.
4. The first allocable IP address found in an address pool.
5. If there is no available IP address, check the IP address whose lease expires and that had conflicts in order. If found, allocate the IP address. If not, no process.

7.10.1.3 Web Configuration

1. Enable DHCP server, as shown below.

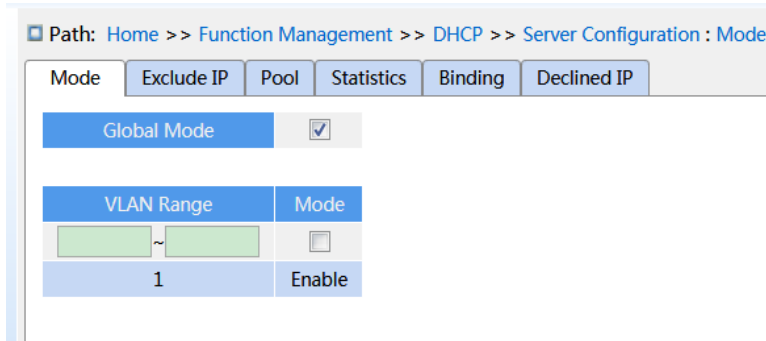

Figure 170 Enable DHCP Server

Global Mode

Configuration options: Disabled/Enabled

Default configuration: Disabled

Function: Select the current switch to the DHCP server to allocate an IP address to a client or not.

{VLAN Range, Mode}

Configuration range: {1~4093, Disabled/Enabled}

Function: If the VLAN of a client that applies for an IP address is set to Enabled, the DHCP server allocates an IP address to the client. Otherwise, the DHCP server does not allocate an IP address to the client.

2. Create DHCP address pool, as shown below.

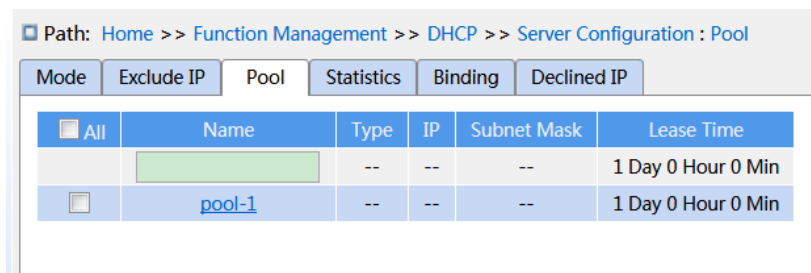

Figure 171 Create DHCP Address Pool

Name

Configuration range: 1~32 characters

Function: configure the name of the IP address pool.

Click <Apply> to create a new DHCP address pool.

3. Configure the DHCP address pool, click <Name> in Figure 171 to configure the DHCP address pool, as shown below.

Path: Home >> Function Management >> DHCP >> Server Configuration : Pool -> Detail Configuration[pool-1]

Figure 172 Configure IP Address Pool

Type

Configuration options: None/Network/Host

Default configuration: None

Function: Configure the address pool type. Network: the switch dynamically allocates IP addresses to multiple DHCP clients. Host: the switch supports static allocation of IP addresses to special DHCP clients.

{IP, Subnet Mask}

Function: Network indicates that you can configure the range of the IP address pool, and the address range is determined by the subnet mask. The subnet mask is a number with a length of 32 bits and consists of a string of 1 and a string of 0. "1" corresponds to network number fields and subnet number fields, while "0" corresponds to host number fields. It is generally configured to 255.255.255.0.

Host indicates that you can configure the IP address of the client statically bounded. Static IP address allocation is implemented by bounding the MAC address and IP address of the client. When the client with this MAC address requests for IP address, the DHCP server finds the IP address corresponding to the MAC address of the client and allocates the IP address to the client. The priority of this allocation mode is higher than that of dynamic IP address allocation, and the tenancy term is permanent.

Lease Time

Configuration range: 0 day 0 hour 0 minute~365 days 23 hours 59 minutes

Default configuration: 1 day 0 hour 0 minute

Description: Configure lease timeout of dynamic allocation. For different address pools, DHCP server can set different address lease time, but the addresses in the same DHCP address pool have the same lease time.

Domain Name

Configuration range: 1~36 characters

Configuration Function: Configure the domain name of the IP address pool. When allocating an IP address to a client, send the domain name suffix to the client too.

Broadcast Address

Format: A.B.C.D

Function: Configure the client broadcast address allocated by DHCP server.

Default Router

Format: A.B.C.D

Function: Configure the client gateway address allocated by DHCP server.

Explanation: when the DHCP client visits the host that is in the different segment, the data must be forwarded via gateways. When the DHCP server allocates IP addresses to clients, it can specify gateway addresses at the same time. DHCP address pool can configure max 4 gateways.

DNS Server

Format: A.B.C.D

Function: Configure the client DNS server address allocated by DHCP server.

Explanation: When visiting the network host via a domain name, the domain name needs to be resolved to an IP address, which is realized by DNS (Domain Name System). In order to let a DHCP client visit a network host via a domain name, when the DHCP server allocates IP addresses to clients, it can specify IP addresses of domain name servers at the same time. DHCP address pool can configure max 4 DNS servers.

NTP Server

Format: A.B.C.D

Function: Configure the client NTP server address allocated by DHCP server.

NetBIOS Node Type

Configuration options: None/B-node/P-node/M-node/H-node

Default configuration: None

Function: Configure the client NetBIOS node type allocated by DHCP server. When the DHCP client uses the NetBIOS protocol for communication on the network, a mapping must be established between the host name and IP address. Different node types obtain the mapping in different modes.

Description: The B-node obtains the mapping in broadcast mode. The P-node obtains the mapping by sending a unicast packet to communicate with the WINS server. The M-node obtains the mapping by sending a broadcast packet the first time. If the M-node fails to

obtain the mapping the first time, it obtains the mapping by sending a unicast packet to communicate with the WINS server the second time. The H-node obtains the mapping by sending a unicast packet to communicate with the WINS server the first time. If the H-node fails to obtain the mapping the first time, it obtains the mapping by sending a broadcast packet the second time.

NetBIOS Scope

Configuration range: 1~36 characters

Function: Configure the NetBIOS name.

NetBIOS Name Server

Format: A.B.C.D

Function: Configure the client WINS server address allocated by the DHCP server.

Explanation: For the client running a Microsoft Windows operating system (OS), the Windows Internet Naming Service (WINS) server provides the service of resolving a host name into an IP address for the host that uses the NetBIOS protocol for communication. Therefore, most Windows OS-based clients require WINS configuration. To enable the DHCP client to resolve a host name into an IP address, specify the WINS server address when the DHCP server allocates an IP address to the client. DHCP address pool can configure max 4 WINS servers.

NIS Domain Name

Configuration range: 1~36 characters

Function: Configure the client NIS domain name allocated by DHCP server.

NIS Server

Format: A.B.C.D

Function: Configure the client NIS server address allocated by DHCP server.

Client Identifier

Configuration options: None/FQDN/MAC

Default configuration: None

Function: When the pool type is host, specify client's unique identifier

Hardware Address

Format: HH-HH-HH-HH-HH-HH (H is a hexadecimal number)

Function: When the pool type is host, configure the MAC address of the client statically bounded.

Client Name

Configuration range: 1~32 characters

Function: Configure client user name.

Vendor i Class Identifier

Configuration range: 1~64 characters

Function: Configure the client Vendor Class Identifier allocated by DHCP server.

Vendor i Specific Information

Configuration range: 1~64 hexadecimal numbers

Function: Configure the client Vendor Specific Information allocated by DHCP server.

4. Configure excluded IP addresses(IP addresses are not allocated dynamically in the DHCP address pool), as shown below.

Figure 173 Configure Excluded IP Addresses

IP Range

Function: Configure the range of IP addresses are not allocated dynamically in the DHCP address pool. When allocating IP addresses, the DHCP server must eliminate the occupied IP address (for example, IP addresses of the gateway and DNS server). Otherwise, the same IP address may be allocated to two clients, causing IP address conflict.

Declined IP Address

Figure 176 View the IP addresses Declined by DHCP Clients

When a client detects that an IP address allocated by the server conflicts with a static IP

address in the same network segment, it sends a decline packet to the server to reject this IP address. The server records the IP address rejected by the client, and will not allocate this IP address to other clients within a certain period of time.

7.10.1.4 Typical Configuration Example

As Figure 177 shows, switch A works as a DHCP server and switch B works as a DHCP client. The port 3 of Switch A connects with the port 4 of Switch B. The client sends out IP address request messages and the server can allocate an IP address to the client in two ways. The excluded IP address range is 192.168.0.1~192.168.0.10 when DHCP server dynamically allocates IP address.

Figure 177 DHCP Typical Configuration Example

Statically allocate IP address

➤ Switch A configuration:

1. Enable DHCP server status in correspond VLANs, as shown in Figure 170.
2. Create a DHCP IP pool: pool-1, as shown in Figure 171.
3. Set the pool type as Host; IP address as 192.168.0.6; mask as 255.255.255.0; Bind the MAC address of switch B: 00-11-22-33-44-55, as shown in Figure 172.

➤ Switch B configuration:

1. Set switch B automatically obtains an IP address through DHCP.
2. The switch B obtains the IP address of 192.168.0.6 and the subnet mask of 255.255.255.0 from the DHCP server, as shown in Figure 178.

7.10.2 DHCP Snooping

7.10.2.1 Introduce

DHCP Snooping is a monitoring function of DHCP services on layer 2 and is a security feature of DHCP, ensuring the security of the client further. The DHCP Snooping security mechanism can control that only the trusted port can forward the request message of the DHCP client to the legal server, meanwhile, it can control the source of the response message of the DHCP server, ensuring the client to obtain an IP address from the valid server and preventing the fake or invalid DHCP server from allocating IP addresses or other configuration parameters to other hosts.

DHCP Snooping security mechanism divides port to trusted port and untrusted port.

Trusted port: it is the port that connects with the valid DHCP server directly or indirectly.

Trusted port normally forwards the request messages of DHCP clients and the response

messages of DHCP servers to guarantee that DHCP clients can obtain valid IP addresses.

Untrusted port: it is the port that connects with the invalid DHCP server. Untrusted port does not forward the request messages of DHCP clients and the response messages of DHCP servers to prevent DHCP clients from obtaining invalid IP addresses.

7.10.2.2 Web Configuration

1. Enable DHCP Snooping function, as shown below.

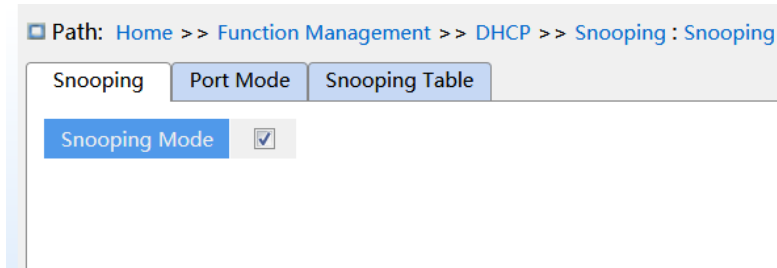

Figure 180 DHCP Snooping State

DHCP Snooping Mode

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable/Disable switch DHCP Snooping function.

Caution:

The switch working as DHCP server and client cannot enable DHCP Snooping function.

2. Configure trusted ports, as shown below.

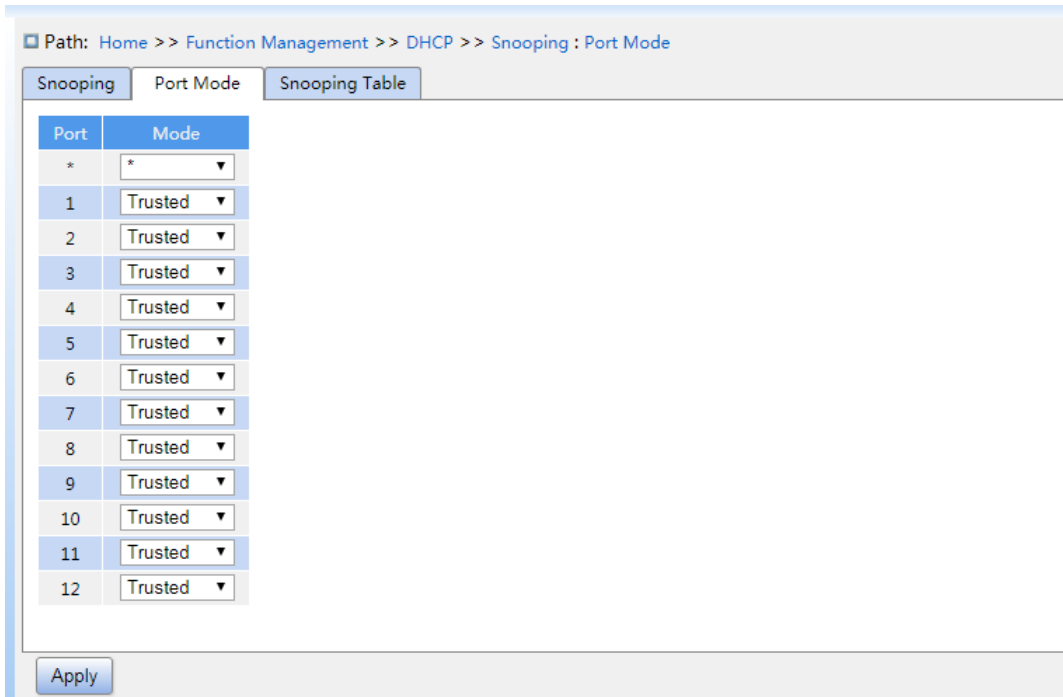

Figure 181 Configure Trust Port

Mode

Configuration options: Trusted/Untrusted

Default configuration: Untrusted

Function: set the port to a trusted port or an untrusted port. The ports that connect with valid DHCP servers directly or indirectly are trusted ports.

3. View DHCP snooping entries, as shown below.

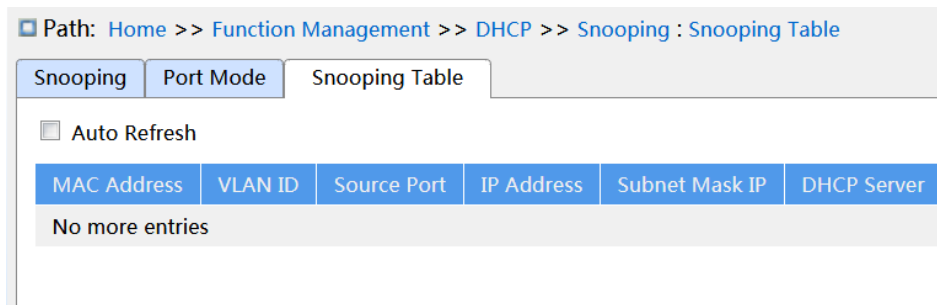

Figure 182 View DHCP snooping entries

7.10.2.3 Typical Configuration Example

As Figure 183 shows, the DHCP client requests an IP address from the DHCP server. An unauthorized DHCP server exists in the network. Set port 1 to a trusted port by DHCP Snooping to forward the request message of the DHCP client to the DHCP server and forward the response message of the DHCP server to the DHCP client. Set port 3 to an untrusted port that cannot forward the request message of the DHCP client and the response message of the unauthorized DHCP server, ensuring that the client can obtain a valid IP address from the valid DHCP server.

Figure 183 DHCP Snooping Typical Configuration Example

Switch B configuration:

- Enable DHCP Snooping function, as shown in Figure 180.
- Set the port 1 of switch B to a trusted port and set the port 3 to an untrusted port, as shown in Figure 181.

7.10.3 DHCP Relay

7.10.3.1 Introduction

1. DHCP Relay

DHCP relay is the forwarding of DHCP packets between the DHCP server and the client. When the DHCP client is not on the same subnet as the server, there must be a DHCP relay to forward DHCP request and reply messages. The data forwarding of the DHCP relay is different from the normal route forwarding. The normal route forwarding is relatively transparent, and the device generally does not modify the IP packet content. However, after receiving the DHCP message, the DHCP relay will regenerate a DHCP message and then forward it out. In the view of the DHCP client, the DHCP relay agent is like a DHCP server; in the view of the DHCP server, the DHCP relay agent is like a DHCP client.

The DHCP relay forwards the received DHCP request packet to the DHCP server in unicast mode, and forwards the received DHCP response packet to the DHCP client. The DHCP relay is equivalent to a forwarding station and is responsible for communicating DHCP clients and DHCP servers located on different network segments. It realizes dynamic IP management for multiple network segments as long as a DHCP server is installed, that is, DHCP dynamic IP management in Client-Relay-Server mode, as shown below.

Figure 184 Client—Relay—Server Mode

2. DHCP Relay Agent Information (option 82)

When the relay device performs DHCP relay, you can add some options to specify some network information of the DHCP client, so that the server can assign different IP addresses to users according to more accurate information. According to RFC3046, the option number of the option option used is 82, so it is also called option 82.

Option 82 (Relay Agent Information Entry) records the client information. When the Option 82 supported DHCP Snooping receives the request message from the DHCP client, it add the corresponding Option 82 field into the messages and then forward the message to the DHCP server. The server supporting Option 82 can flexibly allocate addresses according to the Option 82 message.

Once Option 82 is enabled, the Option 82 field will be added into the message. The Option 82 field of this series switches contains two sub-options: sub-option 1 (Circuit ID) and sub-option 2 (Remote ID). The formats of two sub-options are shown below:

- Sub-option 1 contains the VLAN ID and number of the port that receives the request message from the DHCP client, as shown in Table 7

Table 7 Sub-option 1 Field Format

Sub-option type (0x01)	Length (0x04)	VLAN ID	Port number
One byte	One byte	Two bytes	Two bytes

Sub-option type: the type of the sub-option 1 is 1.

Length: the number of bytes that VLAN ID and Port number occupy.

VLAN ID: On DHCP Relay device, the VLAN ID of the port that receives the request message from the DHCP client.

Port number: On DHCP Realy device, the number of the port that receives the request message from the DHCP client.

- The content of Sub-option 2 is the MAC address of the DHCP Relay device that receives the request message from the DHCP client, as shown in Table 8.

Table 8 Sub-option 2 Field Format-MAC Address

Sub-option type (0x02)	Length (0x06)	MAC Address

One byte	One byte	6 bytes
----------	----------	---------

Sub-option type: the type of the sub-option 2 is 2

Length: the number of bytes that sub-option2 content occupies. MAC address occupies 6 bytes and character string occupies 16 bytes.

MAC address: the content of sub-option2 is the MAC address of the DHCP Realy device that receives the request message from the DHCP client.

If DHCP Relay supports Option 82 function, when the DHCP Relay receives a DHCP request message, it will process the request message according to whether the message contains Option 82 and the client policy, and then forward the processed message to the DHCP server. The specific processing method is shown in Table 9.

Table 9 The treatment request message by DHCP Relay

Receive the request message from the DHCP client	Configuration policy	DHCP Relay device processing the request message
The request message contains Option 82	Drop	Drop the request message
	Keep	Keep the message format unchanged and forward the message
	Replace	Replace the Option 82 field in the message with the Option 82 field of the Snooping device and forward the new message
The request message does not contain Option 82	Drop/Keep/Replace	Add the Option 82 field of the Relay device into the message and forward it

When the DHCP Relay device receives the response message from the DHCP server, if the message contains Option 82 field, remove the Option 82 field and forward the message to the client.

7.10.3.2 Web Configuration

1. DHCP Relay Global Configuration, as shown below.

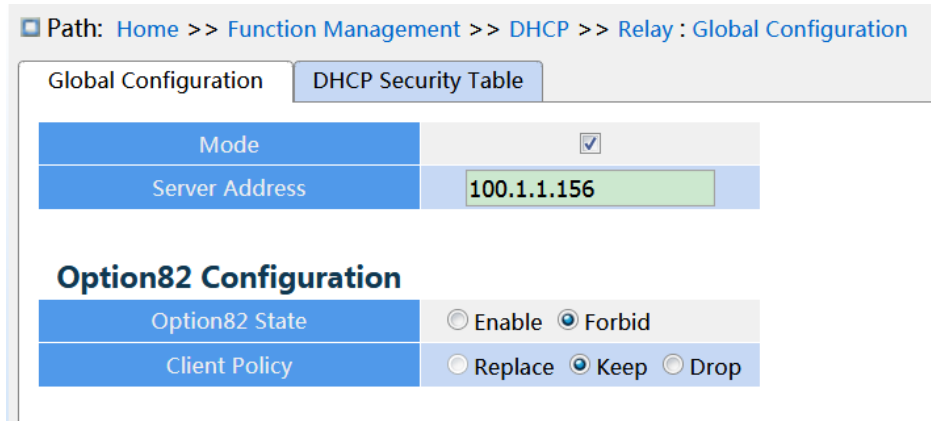

Figure 185 DHCP Relay Global Configuration

Mode

Configuration options: Enable/disable

Default configuration: Disable

Function: whether enable DHCP relay.

Server Address

Function: configure DHCP server address.

Option82 Sate

Configuration options: Enable/forbid

Default configuration: Forbid

Function: whether enable option82 DHCP relay.

Client Policy

Configuration options: Replace/keep/drop

Default configuration: Keep

Function: configure the client policy, DHCP relay process the request message sent by client according to the client policy. The specific treatment as shown in Table 9.

2. View DHCP Security table items, as shown below.

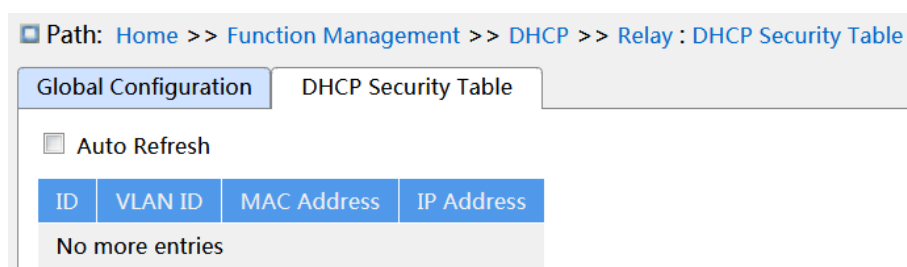

Figure 186 view DHCP Security Table

7.10.3.3 Typical Configuration Example

As shown below, Switch A as the DHCP server, switch B as the DHCP relay, switch C as the DHCP client, and port 1 of switch A connect to port 1 of switch B, port 2 of switch B connect to port 2 of switch C. DHCP server is not in the same LAN as DHCP client. Client dynamically obtain IP address and other network parameters by DHCP mode through DHCP relay.

Figure 187 DHCP typical configuration example

➤ Switch A configuration:

1. Create the VLAN1 and configure the IP: 100.1.1.156, as shown in Figure 114;
2. Open the dhcp server state on the VLAN 1, as shown in Figure 114;
3. Create the address pool pool-33, as shown in Figure 171;
4. elect the address pool type as Network; IP address: 33.1.1.6; Mask: 255.0.0.0;

➤ Switch B configuration:

1. Create the VLAN1 and configure the IP: 100.1.1.180, as shown in Figure 114;
2. Create the VLAN33 and configure IP: 33.1.1.2, as shown in Figure 114;
3. Enable DHCP relay, as shown in Figure 185;
4. Configure server IP address: 100.1.1.156, as shown in Figure 185;

➤ Switch C configuration:

1. Create VLAN33 and enable DHCP Client, as shown in Figure 114;
2. Switch A assign IP address 33.0.0.1 to switch C.

7.11 IEEE802.1X Configuration

7.11.1 Introduction

To ensure WLAN security, IEEE802 LAN/WAN committee proposed the 802.1X protocol. As a common access control mechanism for LAN ports in Ethernet, 802.1X implements Ethernet authentication and security. 802.1X is a port-based network access control. Port-based network access control is to implement authentication and control on the ports of LAN access devices. If a user passes the authentication, it can access the resources in the LAN. If it cannot pass the authentication, it cannot access the resources in the LAN. 802.1X systems adopt the Client/Server structure, as shown in below. User authentication and authorization of port-based access control requires the following elements:

Figure 188 IEEE802.1X Structure

Client: usually indicates a user terminal. When a user wants to surf the Internet, it starts the client program and enters required user name and password. The client program will send a connection request. The client should support EAPOL (Extensible Authentication Protocol over LAN).

Device: indicates the authentication switch in an Ethernet system. It uploads and delivers user authentication information, and enables or disables a port based on the authentication result.

Authentication server: indicates the entity that provides authentication service for devices. It checks whether users have the permissions to use network services according to the identifiers (user names and passwords) sent by clients, and enables or disables ports according to authentication results.

7.11.2 Web Configuration

1. 802.1X Task Manager Configuration, as shown below.

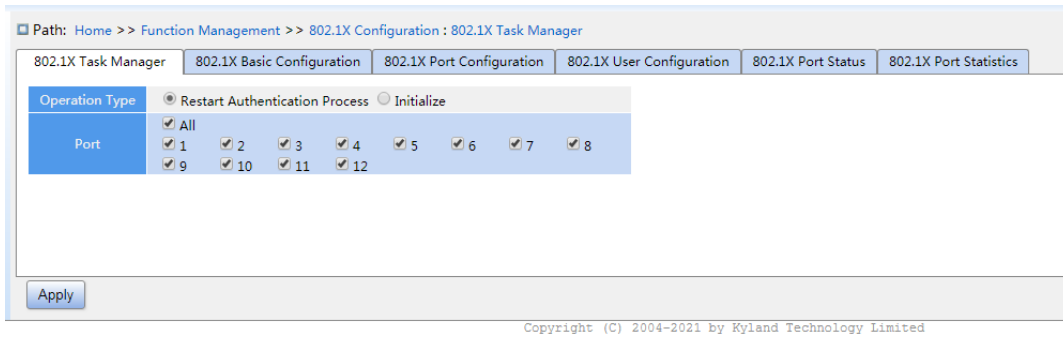

Figure 189 Task Manager configuration

Operation Type

Configuration options: Restart Authentication Process /initialization

Function: When the port selects **Mac-Based** and **port-based** 802.1X authentication mode, you can select <Restart Authentication Process>/<Initialize> to re-authenticate. During the re-authentication process, the port status is switched to the unauthenticated state.

Port

Select the port that needs to Restart Authentication Process /initialize.

2. IEEE802.1X Basic Configuration, as shown below.

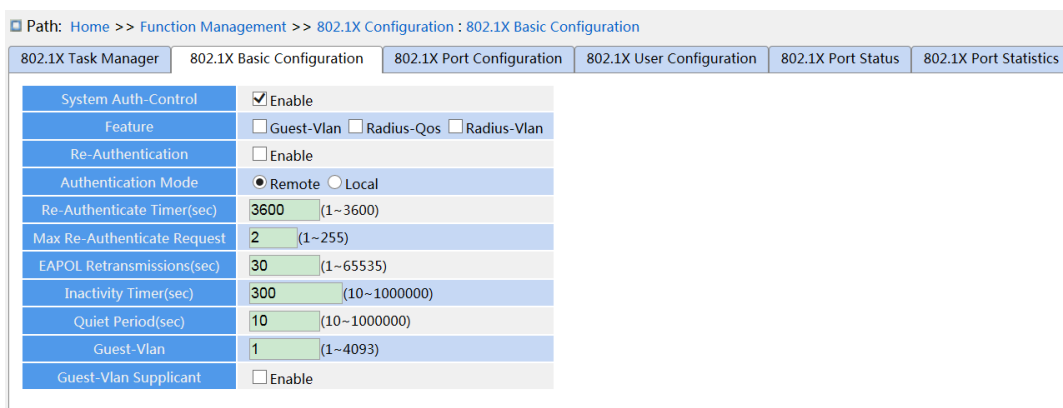

Figure 190 IEEE802.1X Basic Configuration

System Auth-Control

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable/Disable global IEEE802.1x security function.

Guest-VLAN

Configuration options: Enable/Disable

Default configuration: Disable

Function: When enabled, if a user is not authenticated or fails to be authenticated, the device adds the client authentication port to the guest VLAN. All users that access this port are authorized to access the resources in the guest VLAN.

RADIUS-QOS

Configuration options: Enable/Disable

Default configuration: Disable

Function: When enabled, after the client passes authentication, the server transfers authorization information to the device. If **RADIUS-QOS** is checked on the server, the authorization information includes CoS information assigned for authorization. The equipment will modify the CoS value of the client authentication port based on the assigned value.

RADIUS-VLAN

Configuration options: Enable/Disable

Default configuration: Disable

Function: When enabled, after the client passes authentication, the server transfers authorization information to the device. If **RADIUS-VLAN** is checked on the server, the authorization information includes VLAN information assigned for authorization. The equipment will add the client authentication port to the assigned VLAN.

Re-Authentication

Configuration options: Enable/Disable

Default configuration: Disable

Function: Configure whether regular re-authentication is required when authentication succeeds.

Authentication Mode

Configuration options: Remote/Local

Default configuration: Remote

Function: Configure the radius authentication mode as remote authentication or local authentication.

Re-Authenticate Timer(sec)

Configuration range: 1~3600s

Default configuration: 3600s

Function: When authentication succeeds, set the time interval for re-authentication.

“**Re-Authenticate Timer**” can be configured only if enabling “**Re-Authentication**”.

Max Re-Authenticate Request

Configuration range: 1~255

Default configuration: 2

Function: Set the maximum retransmission attempts for Identity EAPOL request packets. If the device still receives no response packets from the client after maximum retransmission attempts, the device will consider authentication fails.

EAPOL Retransmissions

Configuration range: 1~65535s

Default configuration: 30s

Function: Set the overtime for response from the client. After sending a Identity EAPOL request packet, the device will retransmit a Identity EAPOL request packet if it still receives no response from the client after the specified time.

Inactivity Timer

Configuration range :10~1000000s

Default configuration :300s

Function:

After MAC address authentication, if the authentication succeeds, if no packets pass during this time, the corresponding security entry is deleted.

Quiet Period(sec)

Configuration range: 10~1000000s

Default configuration: 10s

Function: If authentication fails, the device enters to quiet period. During the quiet period, the device does not respond to authentication requests from the client.

Guest-VLAN

Configuration range: 1~4095

Default configuration: 1

Function: Configure guest VLAN ID .

Guest-VLAN Supplicant

Configuration options: Enable/Disable

Default configuration: Disable

Function: When enabled, if a user is not authenticated or fails to be authenticated, the device adds the client authentication port to the guest VLAN. When disabled, the device adds the port to the guest VLAN only when this port has no EAPOL frame record.

Caution:

- The precondition for configuring “**Guest-VLAN**”, “**Max Re-Authenticate Request**”, and “**Guest-Vlan Supplicant**” is enabling “**Guest -VLAN**”.
- It is recommended to disable “Radius-Vlan” and “**Guest -VLAN**”, when the authentication port type is Trunk or Hybrid.
- The CoS value assigned for authorization does not change or affect the configuration of the port. However, the priority of the COS value assigned for authorization is higher than a COS value configured by a user. In other words, what is valid after authentication is the CoS value assigned for authorization. If a user fails to be authenticated or goes offline, the CoS value configured by the user take effects.
- The VLAN assigned for authorization or the guest VLAN does not change or affect the configuration of the port. However, the VLAN assigned for authorization or the guest VLAN has a higher priority than a VLAN configured by a user.

After a user initiates authentication, and if the authentication is successful:

If the port enables **RADIUS-VLAN**, the port is added to the VLAN assigned by the RADIUS server.

If the port does not enable **RADIUS-VLAN**, the port is added to the VLAN configured by the user.

If a user fail to be authenticated or goes offline:

If the port enables **Guest-VLAN** and **Guest-Vlan Supplicant**, the port is added to the VLAN.

If the port enables **Guest-VLAN** but does not enable **Guest-Vlan Supplicant**, the port is added to the guest VLAN when no EAPOL fame record is available, and is added to the VLAN configured by the user when EAPOL frame record is available.

If the port does not enable **Guest-VLAN**, the port is added to the VLAN configured by the user.

3. Configure IEEE802.1X port, as shown below.

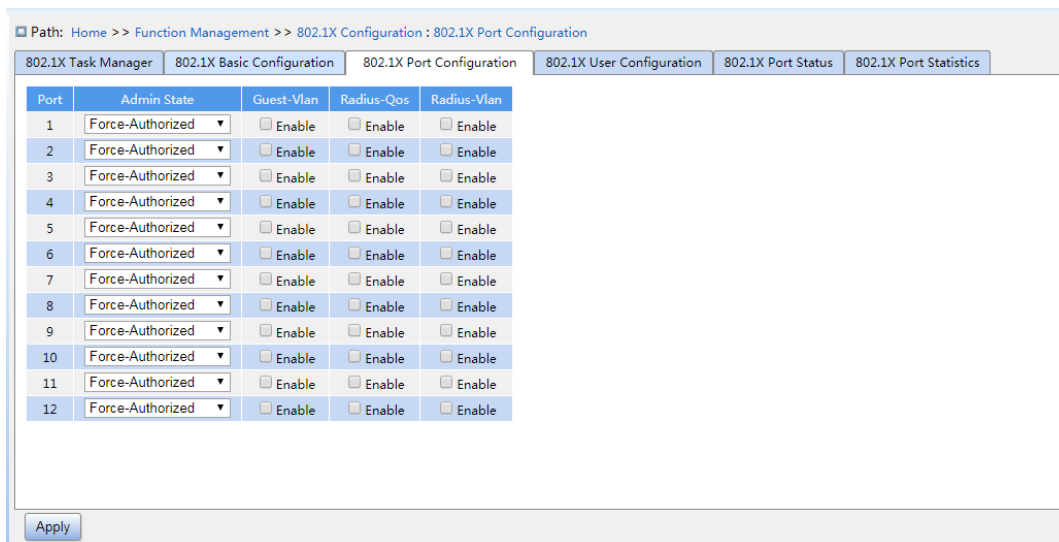

Figure 191 Configure IEEE802.1X port

Port

Configuration options: all switch ports.

Admin State

Configuration options: Force Authorized/Force Unauthorized/Port-based/MAC-based

Default configuration: Force Authorized

Function: Select the port authentication mode.

Description: **Force Authorized** means port is always in an authorized state and allows users

to access network resource without authentication.

Force Unauthorized means the port is always in unauthorized state and does not allow users to conduct authentication and the switch does not provide authentication services to clients that access the switch from this port. **MAC-based** indicates that users using the port need to be authenticated respectively. When a user is offline, only the user cannot use the network. **Port-based** indicates that users are authenticated based on port. After the first user using the port passes authentication, all the other users using the port do not need to be authenticated. However, when the first user is offline, the port is disabled and all the other users using the port cannot use the network.

RADIUS-QOS

Configuration options: Enable/ Disable

Default configuration: Disable

Function: Enable or disable RADIUS-Assigned QoS on port.

RADIUS-VLAN

Configuration options: Enable/ Disable

Default configuration: Disable

Function: Enable or disable RADIUS-Assigned VLAN on port.

Note:

This function is available only when **RADIUS-QOS / RADIUS-VLAN** is enabled at both the global and port levels.

4. IEEE802.1X User Configuration, as shown below.

Figure 192 IEEE802.1X User Configuration

User Name

Configuration range: 1-16 character

Default configuration: None

Function: Configure the local authentication username.

Password

Configuration range: 1-16 character

Default configuration:None

Function: Configure the local authentication password.

5. View IEEE802.1X Port Status, as shown below.

Port	Admin	Port Status	Last Src	Last ID	QoS	VLAN	Guest
1	Force Authorized	Disable	--	--	--	--	--
2	Force Authorized	Disable	--	--	--	--	--
3	Force Authorized	Disable	--	--	--	--	--
4	Force Authorized	Disable	--	--	--	--	--
5	Force Authorized	Disable	--	--	--	--	--
6	Force Authorized	Disable	--	--	--	--	--
7	Force Authorized	Disable	--	--	--	--	--
8	Force Authorized	Disable	--	--	--	--	--
9	Force Authorized	Disable	--	--	--	--	--
10	Force Authorized	Disable	--	--	--	--	--
11	Force Authorized	Disable	--	--	--	--	--
12	Force Authorized	Disable	--	--	--	--	--

Figure 193 IEEE802.1X Port Status

Port Status

Configuration options: Globally Disabled, Authorized, Unauthorized, Link Down, x Auth/y Unauth

Disable、Auth、UnAuth、DOWN、x A/y UnA

Function: Display port authentication state. **Disable** indicates IEEE802.1X is disabled globally; **Auth** indicates the user connected to the port passes authentication; **UnAuth** indicates the user connected to the port fails to pass authentication; **DOWN** indicates the port is link down; **x A/y UnA** indicates x users are authorized and y users are unauthorized when the port authentication mode is MAC-based Auth.

6. View IEEE802.1X statistic, as shown below.

7.11.3 Typical Configuration Example

As shown below, client is connected to port 1 of the switch. Enable IEEE802.1x on port 1 and select **Port-based** authentication mode. The username and password of the remote authentication are both ddd, the rest of the configuration are the default.

Figure 196 IEEE802.1x Configuration Example

You can refer to the typical configuration example in “5.6 RADIUS Configuration”.

7.12 GMRP

7.12.1 GARP Introduction

The Generic Attribute Registration Protocol (GARP) is used for spreading, registering, and cancelling certain information (VLAN, multicast address) among switches on the same network.

With GARP, the configuration information of a GARP member will spread the information to the entire switching network. A GARP member instructs the other GARP members to register or cancel its own configuration information by means of join/leave message respectively. The member also registers or cancels the configuration information of other members based on join/leave messages sent by other members.

GARP involves three types of messages: Join, Leave, and LeaveAll.

- When a GARP application entity wants to register its own information on other switches, the entity sends a Join message. Join messages fall into two types: JoinEmpty and JoinIn. A JoinIn message is sent to declare a registered attribute, while a JoinEmpty message is sent to declare an attribute that is not registered yet.
- When a GARP application entity wants to cancel its own information on other switches, the entity sends a Leave message. Leave messages fall into two types: LeaveEmpty and

LeaveIn. A LeaveIn message is sent to cancel a registered attribute, while a LeaveEmpty message is sent to cancel an attribute that is not registered yet.

- After a GARP entity starts, it starts the LeaveAll timer. When the timer expires, the entity sends a LeaveAll message.

**Note:**

An application entity indicates a GARP-enabled port.

GARP timers include Hold timer, Join timer, Leave timer, and LeaveAll timer.

Hold Timer: When receiving a registration message, a GARP entity does not send a Join message immediately, but starts Hold timer. When the timer expires, the entity sends all the registration messages received within the preceding period in one Join message, reducing packet sending for better network stability.

Join Timer: To ensure that Join messages are received by other application entities, a GARP application entity starts Join timer after sending a Join message. If receiving no JoinIn message before Join timer expires, the entity sends the Join message again. If receiving a JoinIn message before the timer expires, the entity does not send the second Join message.

Leave Timer: When a GARP application entity wants to cancel the information about an attribute, the entity sends a Leave message. The entity receiving the message starts Leave timer. If receiving no Join message before the timer expires, the entity receiving the message cancels the information about the attribute.

LeaveAll Timer: As a GARP application entity starts, it starts LeaveAll timer. When the timer expires, the entity sends a LeaveAll message, so that the other GARP application entities re-register all the attributes. Then the entity starts LeaveAll timer again for the new cycle.

7.12.2 GMRP Protocol

The GARP Multicast Registration Protocol (GMRP) is a multicast registration protocol based on GARP. It is used for maintaining the multicast registration information of switches. All GMRP-enabled switches can receive multicast registration information from other switches, update local multicast registration information dynamically, and spread local multicast registration information to other switches. This information exchange mechanism ensures

the consistency of multicast information maintained by all GMRP-enabled switches on a network.

If a switch or terminal wants to join or leave a multicast group, the GMRP-enabled port broadcasts the information to all the ports in the same VLAN.

7.12.3 Explanation

Agent port: indicates the port on which GMRP and the agent function are enabled.

Propagation port: indicates the port on which only GMRP is enabled, but not the proxy function.

Dynamically learned GMRP multicast entry and agent entry are forwarded by the propagation port to the propagation ports of the lower-level devices.

All GMRP timers on the same network must keep consistent to prevent mutual interference.

The timers should comply with the following rules: Hold timer < Join timer, 2 * Join timer < Leave timer, and Leave timer < LeaveAll timer.

7.12.4 Web Configuration

1. Enable the global GMRP protocol and configure the global timer, as shown below.

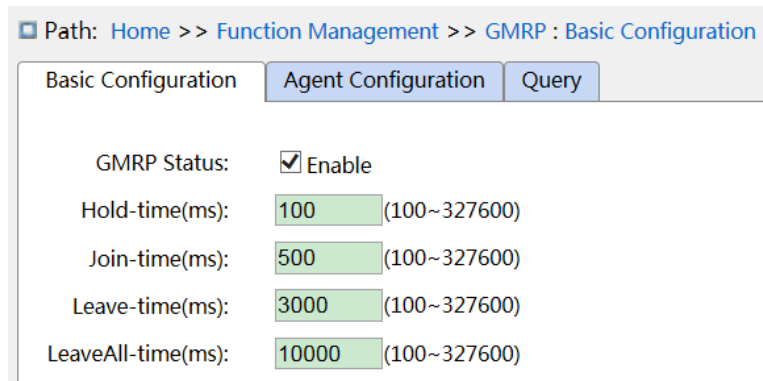

Figure 197 GMRP Global Configuration

GMRP Status

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable/Disable the global GMRP function. The function cannot be used together

with the IGMP Snooping function.

Hold-timer

Configuration range: 100ms~327600ms

Default configuration: 100ms

Description: This value must be a multiple of 100. It is better to set same time of Hold timers on all GMRP-enabled ports

Join-timer

Configuration range: 100ms~327600ms

Default configuration: 500ms

This value must be a multiple of 100. It is better to set same time of Join timers on all GMRP-enabled ports

Leave-timer

Configuration range: 100ms~327600ms

Default configuration: 3000ms

This value must be a multiple of 100. It is better to set same time of Leave timers on all GMRP-enabled ports.

LeaveAll-timer

Configuration range: 100ms~327600ms

Default configuration: 10000ms

Function: The time interval for sending LeaveAll packets. The value must be a multiple of 100.

Explanation: if different devices' LeaveAll timers expire at the same time, they will send multiple LeaveAll messages at the same time, which increases message quantity. In order to avoid the expiration of LeaveAll timers of different devices at the same time, the actual running time of LeaveAll timer is a random value that is longer than the time of one LeaveAll timer, and less than 1.5 times of LeaveAll timer.

2. Configure GMPR function on port, as shown below.

Port	GMRP Enable	GMRP Agent Enable	Last PDU Origin
1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	00-00-00-00-00-00
2	<input checked="" type="checkbox"/>	<input type="checkbox"/>	00-00-00-00-00-00
3	<input type="checkbox"/>	<input type="checkbox"/>	--
4	<input type="checkbox"/>	<input type="checkbox"/>	--
5	<input type="checkbox"/>	<input type="checkbox"/>	--

12	<input type="checkbox"/>	<input type="checkbox"/>	--

Figure 198 Port GMRP Configuration

GMRP Enable

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable GMRP function on port or not

GMRP Agent Enable

Configuration options: Enable/Disable

Default configuration: Disable

Function: Enable GMRP agent function on port or not

Last PDU Origin

Function: Source MAC address of the protocol packet received last by the port.

Caution:

- Agent port cannot propagate agent entry.
- The premise of enabling GMRP agent function on port is to enable GMRP function on port.

3. Add a GMRP agent entry, as shown below.

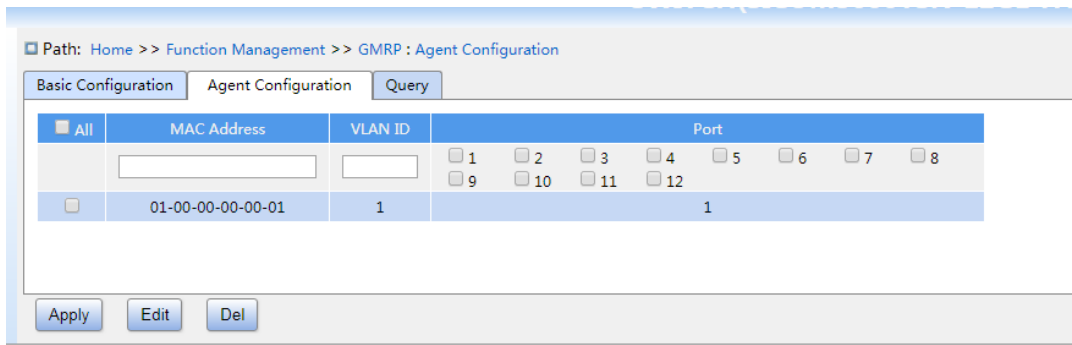

Figure 199 GMRP Agent Entry Configuration

MAC address

Format: HH-HH-HH-HH-HH-HH (H is a hexadecimal number)

Function: Configure the MAC address of multicast group. The lowest bit of the first byte is 1.

VLAN ID

Configuration options: all created VLAN numbers

Function: Configure the VLAN ID for the GMRP agent entry.

Description: GMRP agent entry can only be forwarded from the propagation port with the VLAN ID same as this entry's VLAN ID.

Port

Configuration options: all configured agent ports

4. View GMRP configuration, as shown below.

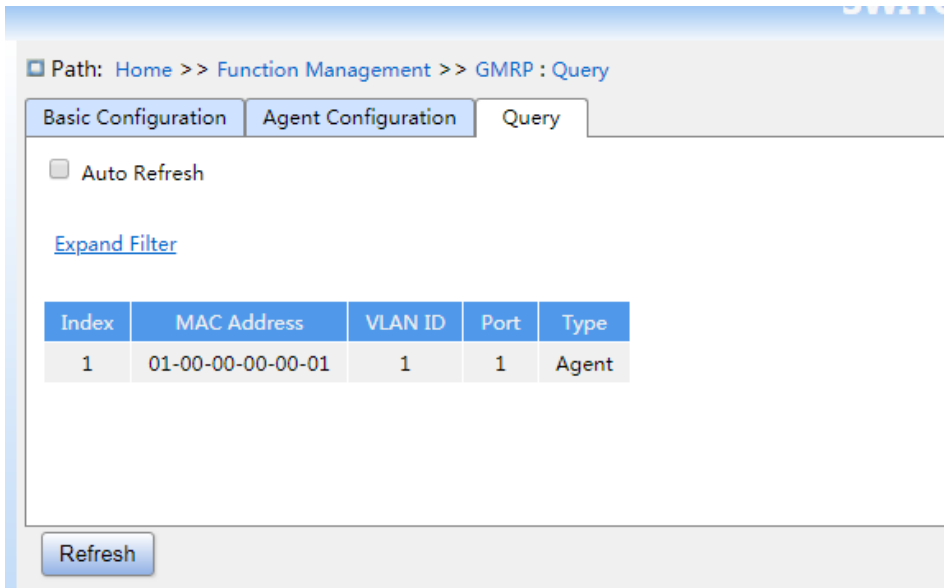

Figure 200 View GMRP configuration information

7.12.5 Typical Configuration Example

As shown below, Switch A and Switch B are connected by port 2. Port 1 of Switch A is set to an agent port and generates two multicast entries:

MAC address: 01-00-00-00-00-01, VLAN: 1

MAC address: 01-00-00-00-00-02, VLAN: 2

After configuring different VLAN attributes on ports, observe the dynamic registration between switches and multicast information update.

Figure 201 GMRP Networking

Configuration on Switch A:

1. Enable global GMRP function in switch A; set timer to the default value, as shown in Figure 197.
2. Enable GMRP function and agent function in port 1; enable only GMRP function in port 2; as shown in Figure 198.
3. Configure agent multicast entry. Set <MAC address, VLAN ID, Member port> to <01-00-00-00-00-01, 1, 1> and <01-00-00-00-00-02, 2, 1>, as shown in Figure 199.

Configuration on Switch B:

4. Enable global GMRP function in switch B; set timer to the default value, as shown in Figure 197.
5. Enable GMPR function in port 2; set the timers to default values, as shown in Figure 198.

Table 10 lists the dynamically learned GMRP multicast entries in Switch B.

Table 10 Dynamic Multicast Entries

Attribute of Port 2 on Switch A	Attribute of Port 2 on Switch B	Multicast Entries Received on Switch B
Access VID=1	Access VID=1	MAC: 01-00-00-00-00-01 VLAN ID: 1 Member port: 2
Access VID=2	Access VID= 2	MAC: 01-00-00-00-00-02 VLAN ID: 2 Member port: 2
Access VID= 1	Access VID= 2	MAC: 01-00-00-00-00-01 VLAN ID: 2 Member port: 2

7.13 Route configuration

To access a remote host on the Internet, a host must select an appropriate route by way of routers or Layer-3 switches. During the process of path selection, each Layer-3 switch selects the path to the next Layer-3 switch according to the destination address of the

received packet, until the last Layer-3 switch sends the packet to the destination host. The path that each Layer-3 switch selects is called a route. Routes fall into the following types:

Direct route: indicates a route discovered by a link layer protocol.

Static route: indicates a route configured by the network administrator manually.

Dynamic route: indicates a route discovered by a routing protocol.

Note: In the series switches, SICOM3000TSN Series support routing protocols.

7.13.1 Routing Table

7.13.1.1 Introduction

Static routes are manually configured. If a network's topology is simple, you only need to configure static routes for the network to work properly. Static routes are easy to configure and stable. They can be used to achieve load balancing and route backup, preventing illegitimate route changes. The disadvantage of using static routes is that they cannot adapt to network topology changes. If a fault or a topological change occurs in the network, the relevant routes will be unreachable and the network breaks. When this happens, the network administrator must modify the static routes manually.

7.13.1.2 Routing Table

Each Layer-3 switch maintains a routing table that records all the routes used by the switch. Each entry in the table specifies which VLAN interface a packet destined for a certain subnet or host should go out to reach the next router or the directly connected destination.

A route entry includes the following items:

Destination: indicates the destination IP address or network.

Network mask: specifies, in company with the destination address, the network where the destination host or Layer-3 switch resides. A logical AND operation between the destination address and the network mask yields the address of the destination network. For example, if the destination address is 129.102.8.10 and the mask 255.255.0.0, the address of the destination network is 129.102.0.0. A network mask is made up of a certain number of consecutive 1s. It can be expressed in dotted decimal format or by the number of the 1s.

Egress: specifies the interface through which a matching IP packet is to be forwarded.

IP address of the next Layer-3 switch (next hop): indicates the new Layer-3 switch that the IP packet will pass by.

Priority: Routes to the same destination but having different next hops may have different priorities and be found by various routing protocols or manually configured. The optimal route is the one with the highest priority.

7.13.1.3 Default Route

To prevent too many entries in a routing table, you can configure a default route. The default route is a static route. If a data packet fails to find a match in the routing table, it is forwarded according to the default route. In a routing table, the default route is the route with both the destination and mask being 0.0.0.0. If a packet does not match any entry in the routing table and no default route is configured, the switch discards the packet and returns an ICMP packet indicating that the destination address or network is unreachable.

7.13.1.4 Web Configuration

1. Static routing configuration, as shown below.

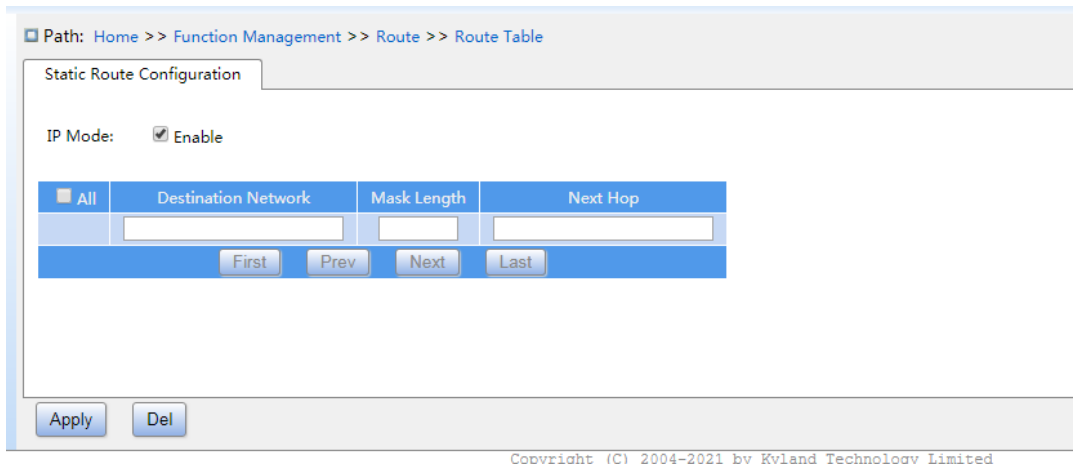

Figure 202 Static routing configuration

IP Mode

Configuration options: Enable/disable

Default configuration: For Layer 3 devices, the default is enabled. For Layer 2 devices, the

default is not enabled.

Function: Enable or disable IP mode.

Destination Network

Configuration format: A.B.C.D

Function: configure the target network address in the static route table.

Mask Length

Function: a subnet mask is a 32-bit number, consisting of a sequence "1" and a sequence "0". "1" corresponds to the network number field and the subnet number field, while "0" corresponds to the host number field. The mask length is the number of 1 in the mask.

Next Hop

Configuration format: A.B.C.D

Function: Configure the next hop IP address.

7.13.1.5 Typical Configuration Example

As shown below, the network masks of all Layer-3 switches and PCs on the network are 255.255.255.0. It is required to configure static routes to enable any of the hosts to communicate with each other.

Figure 203 Example for Configuring Static Routes

Configuration on Switch A:

1. Set IP addresses for VLAN interfaces.

2. Configure a static route with the following parameters:

Destination IP address: 1.1.3.0; destination network mask: 255.255.255.0; default gateway: 1.1.2.2; priority: 1, as shown in Figure 202.

Destination IP address: 1.1.5.0; destination network mask: 255.255.255.0; default gateway: 1.1.2.2; priority: 1, as shown in Figure 202.

Configuration on Switch B:

3. Set IP addresses for VLAN interfaces.

4. Configure a static route with the following parameters:

Destination IP address: 1.1.1.0; destination network mask: 255.255.255.0; default gateway: 1.1.2.3; priority: 1, as shown in Figure 202.

Destination IP address: 1.1.5.0; destination network mask: 255.255.255.0; default gateway: 1.1.4.3; priority: 1, as shown in Figure 202.

Configuration on Switch C:

5. Set IP addresses for VLAN interfaces.

6. Configure a static route with the following parameters:

Destination IP address: 0.0.0.0; destination network mask: 0.0.0.0; default gateway: 1.1.4.2; priority: 1, as shown in Figure 202.

7. Configure the default gateways for host A, host B, and host C as 1.1.1.3, 1.1.3.2, and 1.1.5.2 respectively.

7.14 QoS Configuration

7.14.1 Introduction

Quality of Service (QoS) enables differentiated services based on different requirements under limited bandwidths by means of traffic control and resource allocation on IP networks. QoS tries to satisfy the transmission of different services to reduce network congestion and

minimize congestion's impact on the services of high priority.

Traffic classification, traffic policing, traffic shaping, congestion management, and congestion avoidance are the main concepts of QoS deployment. They mainly complete the following functions:

Traffic classification: identifies an object based on certain matching rules. It is the basis and prerequisite of QoS.

Traffic policing: supervises the traffic rate of packets that are transmitted to a device. When the traffic rate exceeds the specified traffic rate, the device adopts restriction or penalty measures to protect network resources against damage. Traffic policing is classified into port-based traffic policing and queue-based traffic policing.

Traffic shaping: proactively adjusts traffic output rate. It aims at adapting traffic to available network resources of a downstream device to prevent unnecessary packet discarding and congestion. Traffic shaping is classified into port-based traffic shaping and queue-based traffic shaping.

Congestion management: This is mandatory for solving resource competition. Congestion management caches packets in queues and determines the sequence of packet forwarding based on a certain scheduling algorithm, achieving preferential forwarding for key services.

Congestion avoidance: Excessive congestion may result in damage on network resources. Congestion avoidance monitors the use of network resources. When detecting increasing congestion, the function adopts proactive packet discarding and tunes traffic volume to solve the overload.

Traffic policing, traffic shaping, congestion management, and congestion avoidance control the network traffic and allocated resources from different aspects. They are the specific embodiment of QoS. For example, the switch supervises packets that are transmitted to a network based on the committed rate. It conducts shaping on the packets before the packets leave the switch. It conducts queue scheduling management in the case of congestion, and adopts congestion avoidance measures when the congestion is intensifying.

7.14.2 Principle

Each port of this series switches supports 8 cache queues, from 0 to 7 in priority ascending

order.

When a frame reaches the port, the switch determines the queue for the frame according to the frame information and port. This series switches support traffic classification in the following queue mapping modes: port, 802.1Q header information, differentiated services code point (DSCP), and QoS control list (QCL), with the priority in ascending order.

When forwarding data, a port uses a scheduling mode to schedule the data in 8 queues and the bandwidth of each queue. This series switches support two scheduling modes: 6 Queues Weighted and SP (Strict Priority) .

WRR (Weighted Round Robin) schedules data flows based on weight ratio. Queues obtain their bandwidths based on their weight ratio. WRR prioritizes high-weight ratio queues. More bandwidths are allocated to queues with higher weight ratio.

SP mode forwards high-priority packets preferentially. It is mainly used for transmitting sensitive signals. If a frame enters the high-priority queue, the switch stops scheduling the low-priority queues and starts to process the data of the high-priority queue. When the high-priority queue contains no data, the switch starts to process the data of the queue with lower priority.

6 Queues Weighted indicates that queue 6 and queue 7 use the Strict Priority scheduling mode, and queue 0 ~ queue 5 use the WRR scheduling mode. Data in queue 7 is processed prior to data in queue 6. When both queue 7 and queue 6 are empty, data in queue 0 ~ queue 5 is scheduled based on the weight ratio.

7.14.3 Web Configuration

1. Configure queue mapping mode based on port, as shown below.

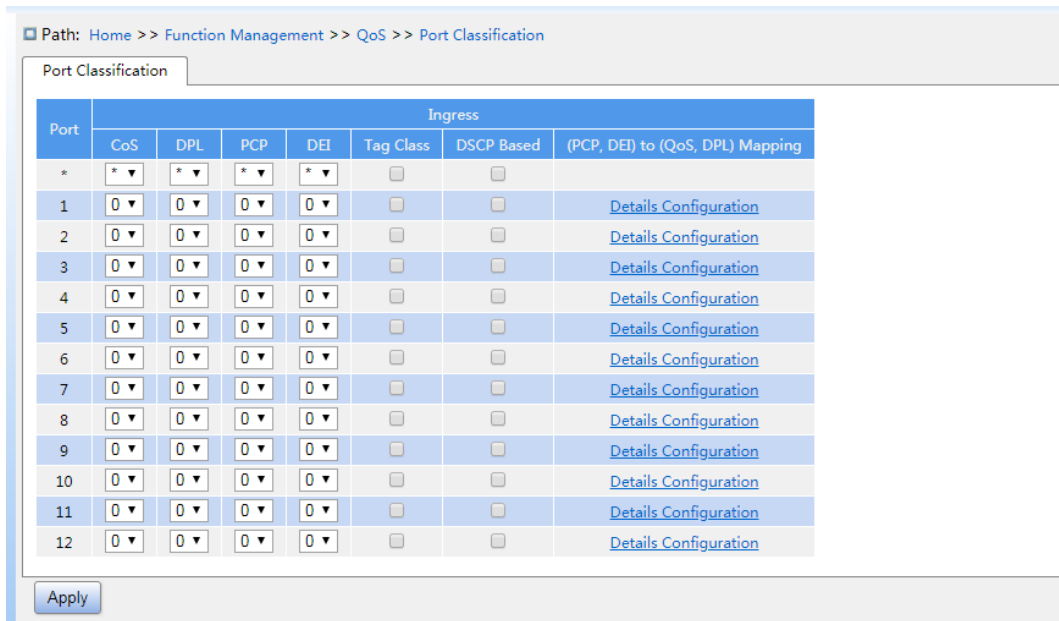

Figure 204 Configure queue mapping mode based on port

CoS

Configuration range: 0~7

Default configuration: 0

Function: Configure the default COS value of the port.

Description: The CoS value determines the storage queue of the message, which corresponds to the queue 0 ~ 7 in turn. When a message enters the switch, the switch assigns CoS value to the message. If the message is tag type and disable tag class, or if the message is untag, the CoS value of the message is the default CoS value of the receiving port.

DPL

Configuration range: 0~1

Default configuration: 0

Function: configure port default DPL vaule (Drop Priority Level)

Description: Specified DPLs is default DPLs of port when Untag messages or disable tag class tag messages enter the switch.

PCP

Configuration range: 0~7

Default configuration: 0

Function: configure port default PCP value (Priority Code Point) .

Description: The priority value in the tag added after the untag message enters the switch is the port default PCP value.

DEI

Configuration range: 0~1

Default configuration: 0

Function: Configure port default DEI value (Drop Eligible Indicator) .

Description: The CFI value in the tag added after the untag message enters the switch is the port default DEI value.

2、Configure queue mapping mode based on 802.1Q header information.

As shown in Figure 204, check <tag class> of port, and click <details configuration> of (PCP, DEI) to (QOS, DPL) mapping, enter the corresponding interface's queue mapping mode configuration interface based on 802.1q header information, as shown below.

Path: Home >> Function Management >> QoS >>

Detail Configuration[2] -> Configuration -> Detail Configuration[1] -> Detail Configuration[2]

PCP	DEI	QoS	DPL
*	*	*	*
0	0	1	0
0	1	1	1
1	0	0	0
1	1	0	1
2	0	2	0
2	1	2	1
3	0	3	0
3	1	3	1
4	0	4	0
4	1	4	1
5	0	5	0
5	1	5	1
6	0	6	0
6	1	6	1
7	0	7	0

Apply Back

Figure 205 Configure queue mapping mode based on 802.1Q header information

Caution:

The queue mapping mode based on 802.1Q header information is only suitable for received messages is tag.

(PCP, DEI) to (QoS class, DP level) mapping

Configuration range: 0~7 (QoS type) 0~1 (DP level)

Default configuration: PCP value 0, 1, 2, 3, 4, 5, 6, 7 map to QoS class 1, 0, 2, 3, 4, 5, 6, 7;

DEI value 0, 1 map to DP level 0, 1.

Function: Configure (PCP, DEI) to (CoS, DPL) mapping according to PCP and DEI value in the message.

Description: The QoS class is equal to the CoS value, which determines the storage queue of the message, corresponding to the queue 0 - 7 in turn. When a message enters the switch, the switch assigns CoS and DPL values to the message. If the message type is tag and enable tag class, the CoS and DPL values of the message are the mapping value from (PCP, DEI) to (CoS, DPL) .

3. Configure 802.1p remarking, as shown below.

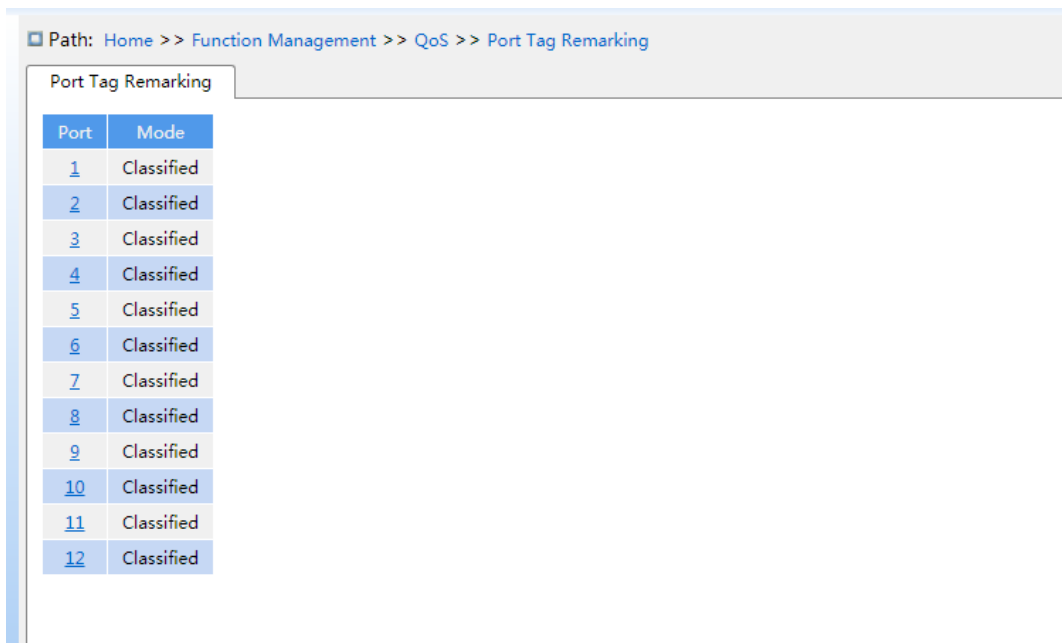

Figure 206 Configure 802.1p remarking

Click <Port >button, enter 802.1p remarking configuraton page, as shown in Figure 207. This page shows the mode of remarking 802.1p when the port forwards the message. The 802.1p remarking indicates PCP and DEI value in the updated message when the port forwards the message.

Figure 207 Configure the 802.1p remarking mode of specified port

Caution:

If there is no tag in the forwarded port message, the 802.1p remarking is invalid.

➤ Configure 802.1p remarking mode as Classified, as shown in Figure 207.

Tag Remarking Mode

Configuration options: Classified/Mapped/Default

Default configuration: Classified

Function: configure 802.1p remarking mode. Classified mode: The PCP and DEI values in the message are not updated when the egressport forwards the message.

➤ Configure 802.1p remarking mode as Default, as shown below.

Figure 208 Configure Default Remarking Mode

Tag Remarking Mode

Configuration options: Classified/Mapped/Default

Default configuration: Classified

Function: configure 802.1p remarking mode. Default mode: When the egressport forwards the message, the PCP and DEI values in the updated message are the default values of the egressport. (configuration as below).

Default PCP

Configuration range: 0~7

Default configuration: 0

Function: configure the default PCP value of the egressport.

Default DEI

Configuration range: 0~1

Default configuration: 0

Function: configure the default DEI value of the egressport.

➤ Configure 802.1p remarking mode as Mapped, as shown below.

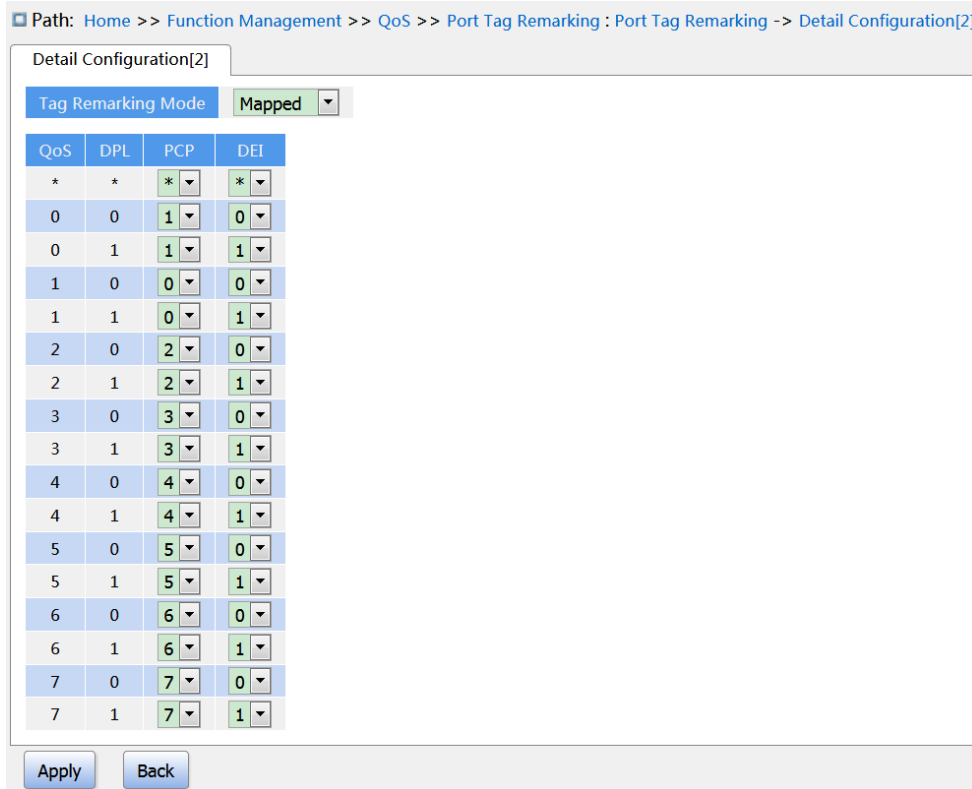

Figure 209 Configure Mapped Remarking mode

Tag Remarking Mode

Configuration options: Classified/Mapped/Default

Default configuration: Classified

Function: configure 802.1p remarking mode. Mapped mode: When the egressport forwards the message, PCP and DEI values in the updated message are mapping value from (CoS, DPL) to (PCP, DEI) . (mapping configuraton as below) .

(QoS class, DP level) to (PCP, DEI) mapping

Configuration options: 0~7 (PCP) 0~1 (DEI)

Default configuration: QoS class 0, 1, 2, 3, 4, 5, 6, 7 map to PCP value 1, 0, 2, 3, 4, 5, 6, 7; DP level 0, 1 map to DEI value 0, 1.

Function: according to CoS and DPL value in the message, configure (CoS, DPL) to (PCP,

DEI) mapping.

4. Enable queue mapping mode based on DSCP, as shown below.

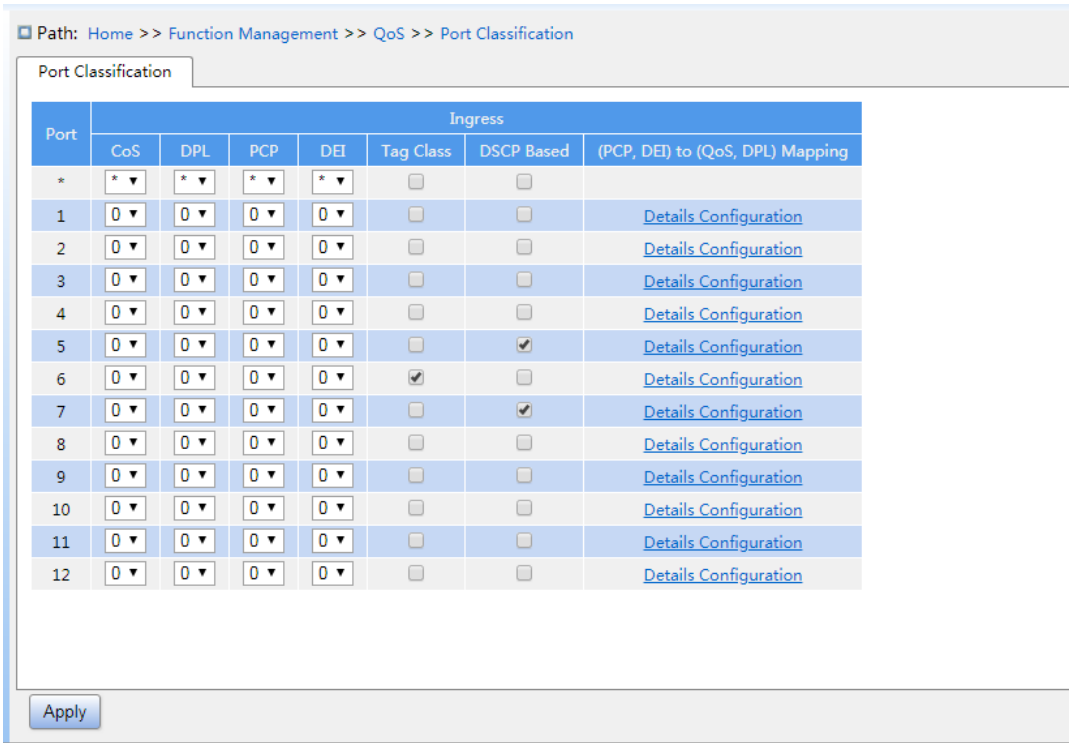

Figure 210 Enable queue mapping mode based on DSCP

DSCP Based

Configuration options: Enable/disable

Default configuration: Disable

Function: whether enable queue mapping mode based on DSCP, the queue mapping mode priority is higher than the queue mapping mode based on 802.1Q header information.

5. Enable Translate of ingress port, rewrite of egress port, as shown below.

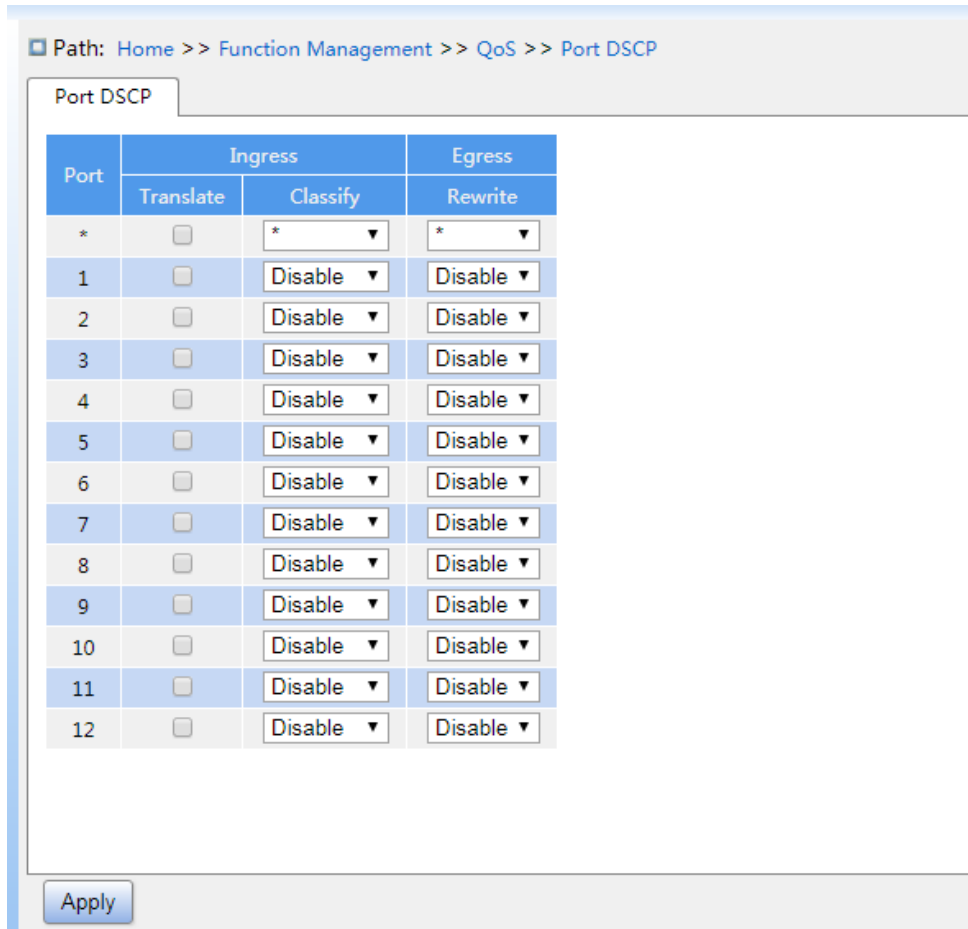

Figure 211 Configure Port DSCP

Translate

Configuration options: Enable/disable

Default configuration: Disable

Function: After the ingress port receives the message, whether translating the dscp value in the message. If enable, the DSCP value is translated according to the DSCP translation table. (the “translate” column in Figure 213).

Classify

Configuration options: Disable/DSCP=0/Selected/All

Default configuration: Disable

Function: Rewrite is configured as Enable, this parameter selects the DSCP value that the

egress port rewrite.

Disable: When egress port forwards the message, the DSCP value in the message is not rewritten;

DSCP=0: When egress port forwards the message, if DSCP=0 in the message, then the DSCP value in the message is rewritten according to the classify rule in Figure 214;

Selected: When egress port forwards the message, if DSCP is selected value (the “classify” column in Figure 213, then the DSCP value in the message is rewritten according to the classify rule in Figure 214;

All: When egress port forwards the message, the DSCP is rewritten according to the classify rule in Figure 214.

Rewrite

Configuration options: Disable/enable/remap

Default configuration: Disable

Function: Configure rewrite mode of the DSCP value when the egress port forwards message.

Disable: When egress port forwards the message, the DSCP value in the message is not rewritten;

Enable: When egress port forwards the message, whether to rewrite the DSCP value in the message according to the classify configuration.

Remap: When egress port forwards the message, the DSCP in the message is rewritten according to (DSCP, DPL) to DSCP mapping (“remap DP0, DP1” in Figure 213).

6. Configure queue mapping mode based on DSCP, as shown below.

Path: Home >> Function Management >> QoS >> DSCP-Based QoS

DSCP-Based QoS

DSCP	Trust	CoS	DPL
*	<input type="checkbox"/>	* ▼	* ▼
0	<input type="checkbox"/>	0 ▼	0 ▼

13	<input type="checkbox"/>	0 ▼	0 ▼
14	<input type="checkbox"/>	0 ▼	0 ▼

Apply

Figure 212 Configure queue mapping mode based on DSCP

Trust

Configuration options: Enable/disable

Default configuration: Disable

Function: whether trust the DSCP value.

Caution:

The queue mapping mode based on DSCP only applies to the DSCP value of the message received by the port as trust value.

COS

Configuration range: 0~7

Default configuration: 0

Function: Configure DSCP to CoS mapping.

Description: The CoS value determines the stored queue of message, CoS value 0 ~ 7 corresponds to the queue 0~7 in turn. When a message with a DSCP value as trust enters the switch, the switch assigns CoS value to the message according to DSCP to CoS mapping

Caution:

When the ingress port enables translate, the switch assigns the CoS value according to the translated DSCP value; otherwise, the switch assigns the CoS value according to the original DSCP value in the message.

DPL

Configuration range: 0~1

Default configuration: 0

Function: Configure DSCP to DPL mapping

Description: After the message with DSCP value as trust enters the switch, the switch assigns the DPL value to the message according to DSCP to DPL mapping.

7. Configure DSCP translate and rewrite, as shown below.

Path: Home >> Function Management >> QoS >> DSCP Translation

DSCP Translation

Figure 214 Configure DSCP Classification

DSCP DP0/DSCP DP1

Configuraton range: 0~63

Function: Configure (CoS, DPL) to DSCP mapping. QoS classification is equal to the CoS value, which determines the storage queue of the message, CoS value corresponds to the queue 0 ~ 7 in turn.

9. Configure QCL table items, as shown below.

Figure 215 Configure QCL table

The queue mapping of messages is realized by matching QCL table, each QCL table item has several QCL conditions, these conditions are the relation of " and ", and the message received by the member port only meet all conditions then it can be as match QCL table. There is no dependency between each QCL table.

When there are multi QCL table items, the device compares the message to the QCL table items one by one (from top to bottom order in the table), once the message finds the matching first QCL table item, an action is performed.

Click<+>button, create a QCL table item; check one table item, click <Edit> button, edit current table item; check one table item, click button, delete current table item. QCE is QCLtable ID number, sequentially numbered according to create table order.

Port

Function: Select the active port of the current QCL table item.

➤ Configure QCL table parameters, as shown below.

DMAC

Configuration options: Any/ Unicast/ Multicast / Broadcast

Default configuration: Any

Function: configure condition parameter— destination MAC address, when the destination MAC address in the message received by the member port satisfies the parameter configuration, the condition matches successfully.

SMAC

Configuration options: Any/ Specific

Default configuration: Any

Function: configure condition parameter—source MAC address, select Specific, need to configure a MAC address, when the source MAC address in the message received by the member port satisfies the parameter configuration, the condition matches successfully.

Tag

Configuration options: Any/ Untagged/ Tagged

Any

Function: configure condition parameter –Tag. When the message received by the member port satisfies the parameter configuration, the condition matches successfully.

VID

Configuration options: Configuration options:Any/ Specific (1~4093) / Range (1~4093)

Default configuration: Any

Function: configure condition parameter --VID, select Specific, need to configure VID value; Select Range, need to configure VID range. when the VID in the message received by the member port satisfies the parameter configuration, the condition matches successfully. When tag parameter configured as Untagged, the parameter can't be configured.

PCP

Configuration options: Any/0/1/2/3/4/5/6/7/0-1/2-3/4-5/6-7/0-3/4-7

Default configuration: Any

Function: configure condition parameter –PCP. When the PCP in the message received by the member port satisfies the parameter configuration, the condition matches successfully. When tag parameter configured as Untagged, the parameter can't be configured.

DEI

Configuration options: Any/0/1

Default configuration: Any

Function: configure condition parameter –DEI. When the DEI in the message received by the member port satisfies the parameter configuration, the condition matches successfully. When tag parameter configured as Untagged, the parameter can't be configured.

Frame Type

Configuration options: Any/ EtherType/ LLC/ SNAP/ IPv4

Default configuration: Any

Function: Select frame type.

Click any QCL frame type field to enter the detail configuration interface.

- Configure EtherType frame parameters, as shown below.

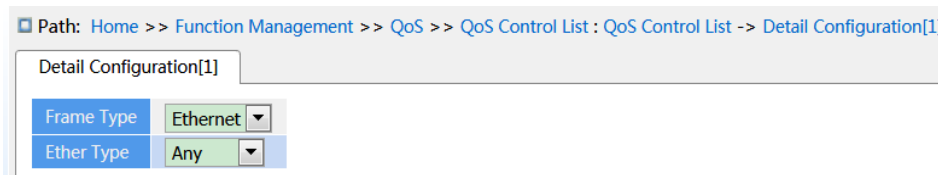

Figure 216 Configure EtherType frame parameters

Ether Type

Configuration options: Any/ Specific (0x600-0x7FF,0x801-0x86DC,0x86DE-0xFFFF)

Default configuration: Any

Function: configure condition parameter –ethernet type, select Specific, need to configure ethernet type value. When the ethernet frame received by the member port satisfies the parameter configuration, the condition matches successfully.

- Configure LLC frame parameters, as shown below.

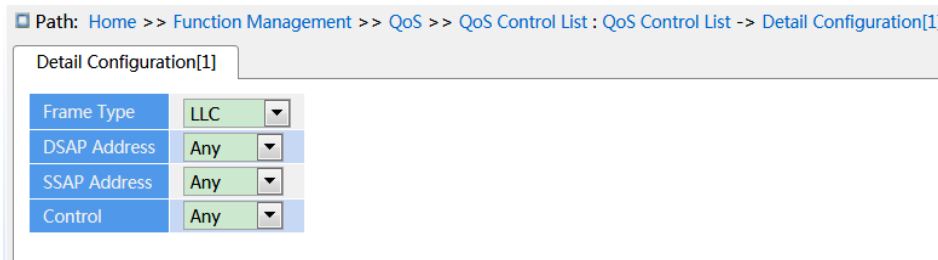

Figure 217 Configure LLC frame parameters

DSAP Address/SSAP Address/Control

Configuration options: Any/Specific (0x00~0xFF)

Default configuration: Any

Function: configure condition parameter –LLC frame parameters, select Specific, need to configure detail value. When the LLC frame received by the member port satisfies the parameter configuration, the condition matches successfully.

➤ Configure SNAP frame parameters, as shown below.

Figure 218 Configure SNAP frame parameters

PID

Configuration options: Any/ Specific (0x0000~0xFFFF)

Default configuration: Any

Function: configure condition parameter –SNAP frame parameters, select Specific, need to configure PID value. When the PID in the SNAP frame received by the member port satisfies the parameter configuration, the condition matches successfully.

➤Configure IPv4 frame parameters, as shown below.

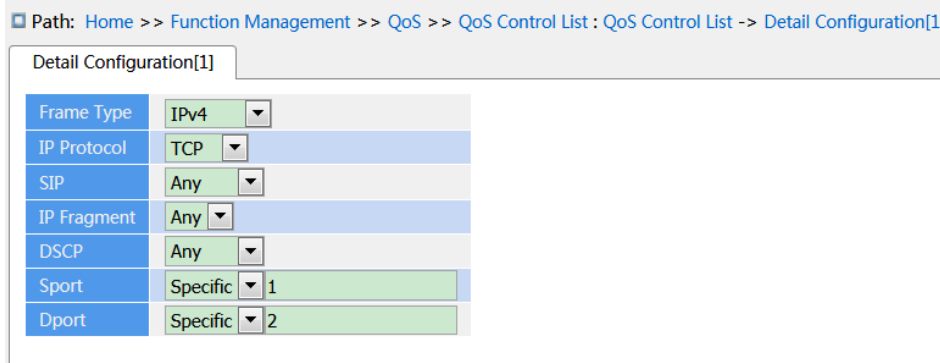

Figure 219 Configure IPv4 frame parameters

Protocol

Configuration options: Any/ UDP/ TCP/ Other (0~255)

Default configuration: Any

Function: configure condition parameter --IPv4 frame protocol type. Select UDP/ TCP, need to configure source and destination port number; Select Other, need to configure protocol number. When the protocol type in the IP frame received by the member port satisfies the parameter configuration, the condition matches successfully.

Sport/ Dport

Configuration options: Any/ Specific (0~65535) / Range (0~65535)

Default configuration: Any

Function: Configure condition parameter --TCP/ UDP source and destination port number, select Specific, need to configure port number; select Range, need to configure port number range. When the port number in the IP frame received by the member port satisfies the parameter configuration, the condition matches successfully.

SIP

Configuration options: Any/ Specific

Default configuration: Any

Function: Configure condition parameter --source IP address and source IP mark, select Specific, need to configure IP address and mark. When the SIP in the IP frame received by the member port satisfies the parameter configuration, the condition matches successfully.

IP Fragment

Configuration options: Any/ Yes/ No

Default configuration: Any

Function: Configure condition parameter --IP fragment frame. When the Fragment in the IPv4 frame received by the member port satisfies the parameter configuration, the condition matches successfully.

DSCP

Configuration options: Any/ Specific (0~63) / Range (0~63)

Default configuration: Any

Function: Configure condition parameter --DSCP value, select Specific, need to configure DSCP value; Select Range, need to configure DSCP range. When the DSCP in the IP frame received by the member port satisfies the parameter configuration, the condition matches successfully.

➤ Configure QCL table action, as shown in Figure 215.

CoS

Configuration options: 0~7/ Default

Default configuration: Default

Function: When the frame received by the member port matches the QCL table item, modify

the CoS of frame to this configuration value. The value of CoS determines that the stored queue of frame, the CoS value of 0 ~ 7 corresponding to the queue of 0 ~ 7 in turn, default means do not modify the CoS value of frame.

DPL

Configuration options: Default/ 0/ 1

Default configuration: Default

Function: When the frame received by the member port matches the QCL table item, modify the DPL of frame to this configuration value. Default means do not modify the DPL value of frame.

DSCP

Configuration options: Default/ 0~63

Default configuration: Default

Function: When the frame received by the member port matches the QCL table item, modify the DSCP of frame to this configuration value. Default means do not modify the DSCP value of frame.

PCP

Configuration options: Default/ 0~7

Default configuration: Default

Function: When the frame received by the member port matches the QCL table item, modify the PCP of frame to this configuration value. Default means do not modify the PCP value of frame.

DEI

Configuration options: Default/ 0/ 1

Default configuration: Default

Function: When the frame received by the member port matches the QCL table item, modify the DEI of frame to this configuration value. Default means do not modify the DEI value of frame.

➤ View QCL table item, as shown below.

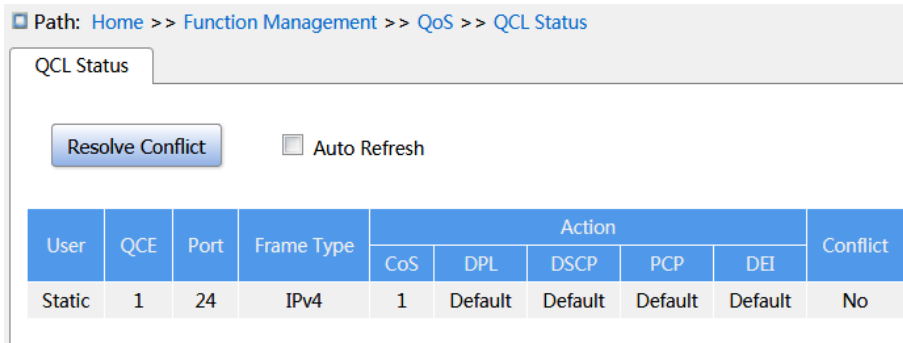

Figure 220 View QCL Table item

Conflict

Display configuration: No/Yes

Function: Display conflict status of QCL table item. If there are not enough resources to create an QCL table, the table item conflict state is Yes. otherwise is No.

Click <Resolve Conflict > button, releases the required resources for conflicting QCL table items to eliminate conflicts.

10. Configure traffic monitoring based on queue, as shown below.

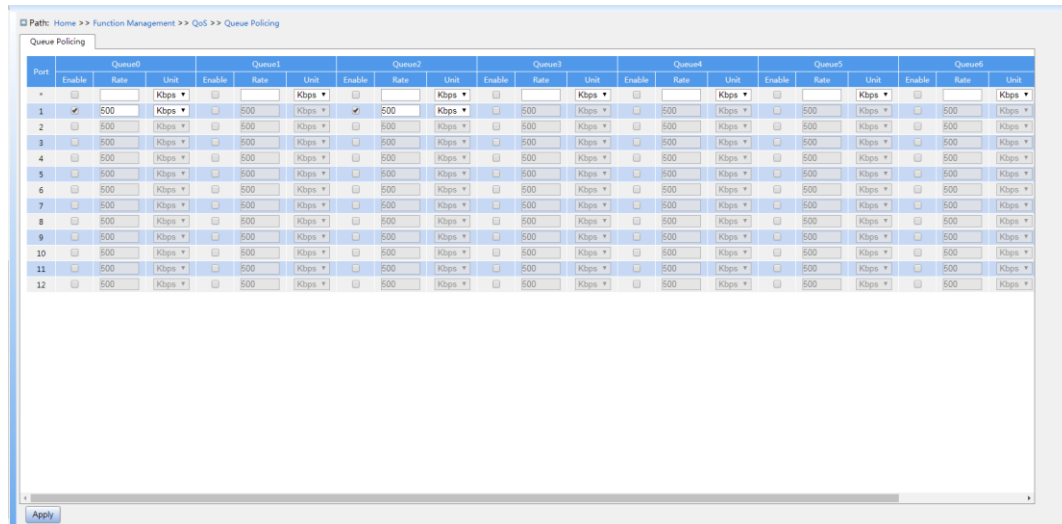

Figure 221 Configure Queue Policing

Enable

Configuration options: Enable/disable

Default configuration: Disable

Function: Whether enable queue policing, need to configure rate and unit parameters after enable.

Rate, Unit

Configuration range: 25~13128147kbps/ 1~13128Mbps

Default configuration: 500kbps

Function: Limit the rate of the amount of frame received by queue on a port, and drop the frame exceed the limited value.

11. Configure port queue scheduler mode, as shown in Figure 222 and Figure 223.

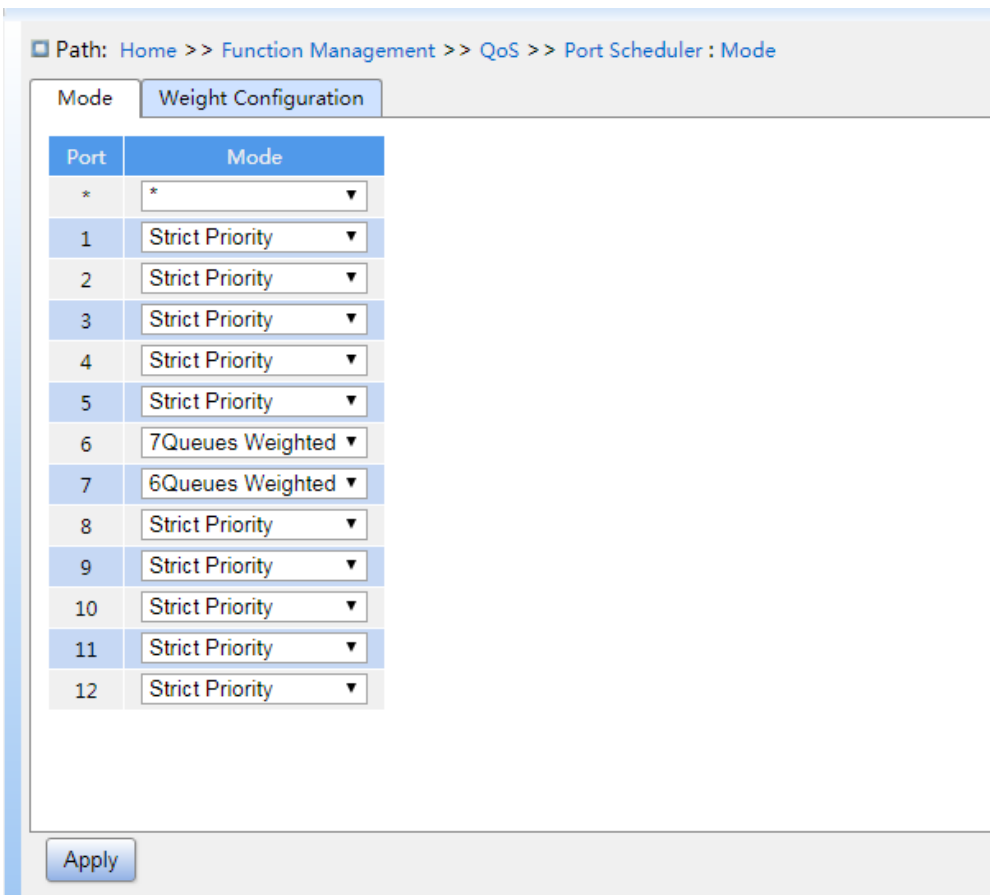

Figure 222 Configure port queue scheduler mode

Path: Home >> Function Management >> QoS >> Port Scheduler : Weight Configuration

Mode Weight Configuration

Port	Weight							
	Queue0	Queue1	Queue2	Queue3	Queue4	Queue5	Queue6	Queue7
1	--	--	--	--	--	--	--	--
2	--	--	--	--	--	--	--	--
3	--	--	--	--	--	--	--	--
4	--	--	--	--	--	--	--	--
5	--	--	--	--	--	--	--	--
6	17	17	17	17	17	17	17	--

Figure 223 Configure port wrr weight of scheduler

Schdduler Mode

Configuration options: Strict Priority /2-8 queues weighted

Default configuration: Strict Priority

Function: Configure port queue scheduler mode.

Weight

Configuration range: 1~100

Default configuration: 17

Function: Configure queue weight.

12. Configure Port Shaping, as shown below.

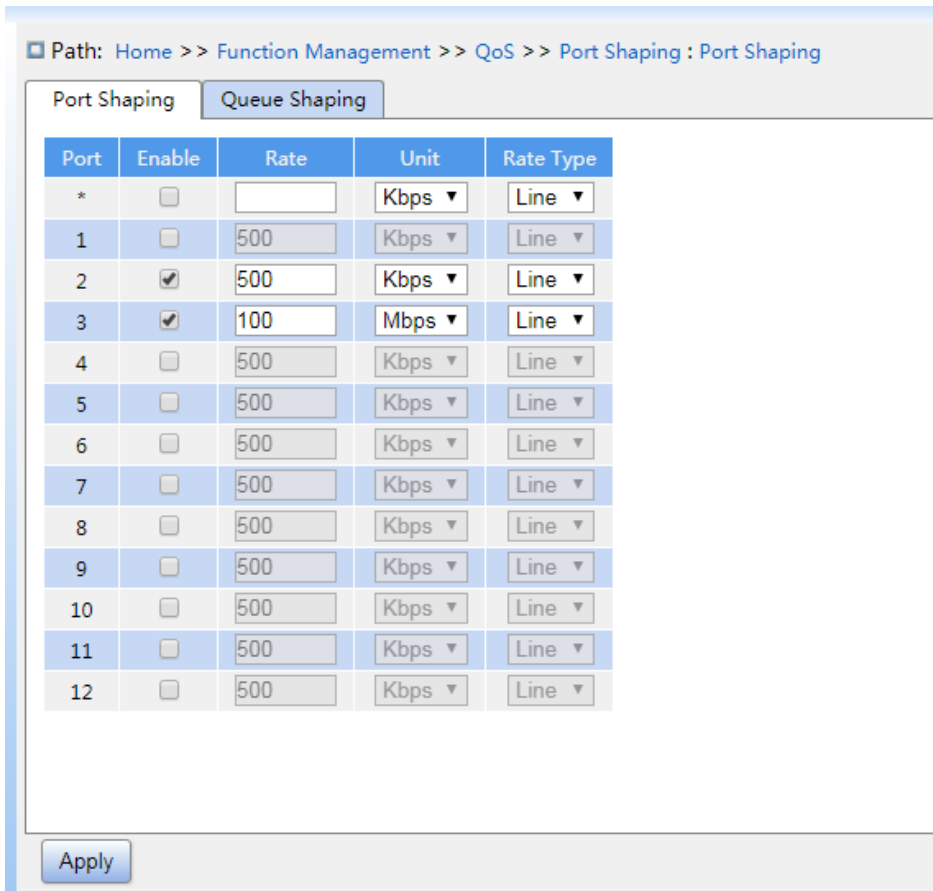

Figure 224 Configure Port Shaping

Enable

Configuration options: Enable/disable

Default configuration: disable

Function: whether enable port shaping. Port traffic shaping through the port rate limit to achieve.

Rate, Unit

Configuration range: 100~13107100kbps/ 1~13107Mbps

Default configuration: 500kbps

Function: Limit the rate of the amount of frame transmitted by port, and drop the frame exceed the limited value.

Rate type

Configuration range: Line/Data

Default configuration: Line

Function: Specify the shaping limit value effective mode. Line refers to limit rate for the total length of a frame, Data refers to limit rate for the effective length of frame.

13. Configure Queue shaping, as shown below.

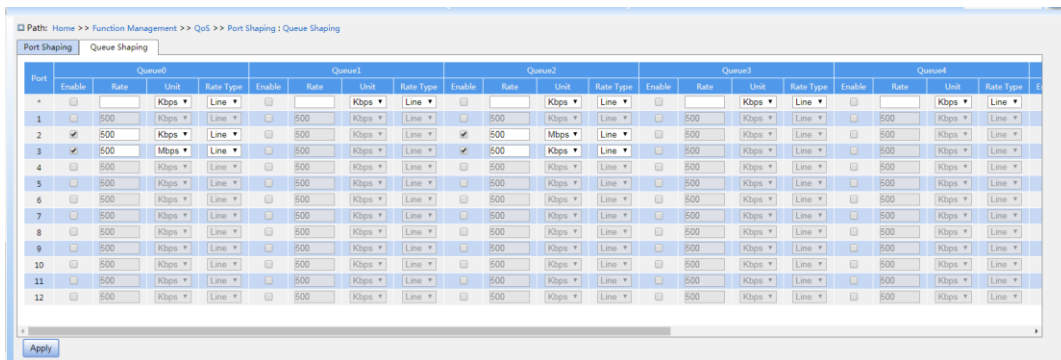

Figure 225 Configure Queue shaping

Enable

Configuration options: Enable/disable

Default configuration: disable

Function: whether enable queue shaping.

Rate, Unit

Configuration range: 100~13107100kbps/ 1~13107Mbps

Default configuration: 500kbps

Function: Limit the rate of the amount of frame transmitted by queue on port, and drop the frame exceed the limited value.

Rate type

Configuration options: Line/Data

Default configuration: Line

Function: Specify the shaping limit value effective mode. Line refers to limit rate for the total length of a frame, Data refers to limit rate for the effective length of frame.

7.14.4 Typical Configuration Example

As shown in Figure 226, port1~port5 forward packet to port 6. Among them,

The packets received by port1 are Untag, and the packets entering port 1 are mapped to queue 2.

The PCP value of port 2 received packet is 0, DEI value is 1, and the packets entering port 2 are mapped to queue 3.

The DSCP value of port 3 received packet is 4, and the packets entering port 3 are mapped to queue 6.

Port 4 maps all received packets with the source MAC address of 00-00-00-00-00-23 to queue 5 and changes the DSCP value in these packets to 9 for forwarding.

The DSCP value of port 5 received packet is 5, and the packets entering port 5 are mapped to queue 2.

Port 6 adopts SP+WRR scheduling mode.

Configuration process:

1. Set the CoS value of port 1 is 2, as shown in Figure 204.
2. Enable Tag Class of port 2, and map (PCP=0, DEI=1) to CoS=3, as shown in Figure 205.
3. Enable DSCP Based of port 3 and port 5, as shown in Figure 210.
4. Trust DSCP value 4 and 5, and map DSCP value 4 to queue 6 and DSCP value 5 to queue 2, as shown in Figure 212.
5. Congiure a QCL entry for port 4, set SMAC to 00-00-00-00-00-23, entry action parameters: set CoS value to 5 and DSCP value to 9, as shown in Figure 215.
6. Configure port 6 queue scheduling mode to 6 Queues Weighted, queue weight of Q0~Q5 to 20, 40, 40, 20, 20, 20, as shown in Figure 222 and Figure 223.

Figure 226 QoS Configuration Example

Port1 and port5 packets enter queue 2, port2 packets enter queue 3, port3 packets enter queue 6, port4 packets enter queue 5.

Queue 6 and queue 7 use the strict priority scheduling mode, and queues 0 through 5 uses the WRR scheduling mode. Data in queue 6 is processed first. When queue 6 is empty, data in queues 0 through 5 is scheduled by weight ratio.

The queue weight are 20, 40, 40, 20, 20, 20. So the bandwidth proportion allocated to the packets in ingress queue 2 is $40 / (20+40+40+20+20+20) = 25\%$, that allocated to the packets in ingress queue 3 is $20 / (20+40+40+20+20+20) = 13\%$, and that allocated to the packets in ingress queue 5 is $20 / (20+40+40+20+20+20) = 13\%$. Among them, port 1 and port 5 packets both enter queue 2, so they are forwarded according to the rule of First In, First out (FIFO), but the total bandwidth proportion of port 1 and port 5 must be 25%.

7.15 TSN

7.15.1 Presentation

TSN (Time Sensitive Networking) refers to a real-time network based on traditional Ethernet, which uses accurate time synchronization, limits transmission delay by ensuring bandwidth, and provides high-level service quality to support various industrial applications.

7.15.2 Principle

- 1) Time synchronization

The time sensitive network switch should meet the requirements PTP accurate clock synchronization protocol in the IEEE 1588v2 and the PTP generalized accurate clock synchronization protocol in IEEE 802.1AS. The time sensitive network switch should support two clock sources: local clock source and TOD clock source, and support to configure time level and time accuracy for TOD clock source.

The time-sensitive network switch supports sending, receiving and identifying the clock priority, clock level, clock accuracy and other parameters in the announce message, and supports the dynamic election of the optimal clock through the BMC algorithm. Synchronize frequency, measure delay and calculate clock synchronization by the event message and the general message.

The synchronization accuracy shall not be greater than the minimum scheduling cycle and gating cycle, and the synchronization accuracy should be guaranteed within at least 1 us, and it is better to guarantee 100 ns.

2) Traffic scheduling

A time-sensitive network switch should meet the IEEE802.1Qbv gating scheduling mechanism to schedule the traffic of downlink queue. Each queue gating is opened and closed at the same time by configuration. When the queue is closed, the message entering the queue should be stored in the buffer and should not enter the sending port. When the queue is open, the message entering the queue should be sent normally.

The time-sensitive network switch should meet the relevant regulations of the message preemption mechanism in the IEEE802.1Qbu and IEEE802.3br, and mark the received message as can be preempted and preemptive frame according to the priority. The transmission process of preemptive frame entering into preemptive MAC channel can be interrupted by preemptive frame entering express MAC channel.

The time-sensitive network switch should meet the relevant regulations of IEEE802.1QCi flow filtering and supervision mechanism, identify specific data flow by mac address, VLAN, priority, etc., filter and supervise the flow at the entrance of the queue, and configure the flow filter configuration template according to the port and time window to ensure that the marked message is transmitted in the correct time slice and port.

3) Management function

Time-sensitive network switch shall comply with the NETCONF protocol specified in the IETF RFC6241, RFC6242 and must implement all NetConf operation and Yang models.

7.15.3 Web page configuration

1、Qbv configuration

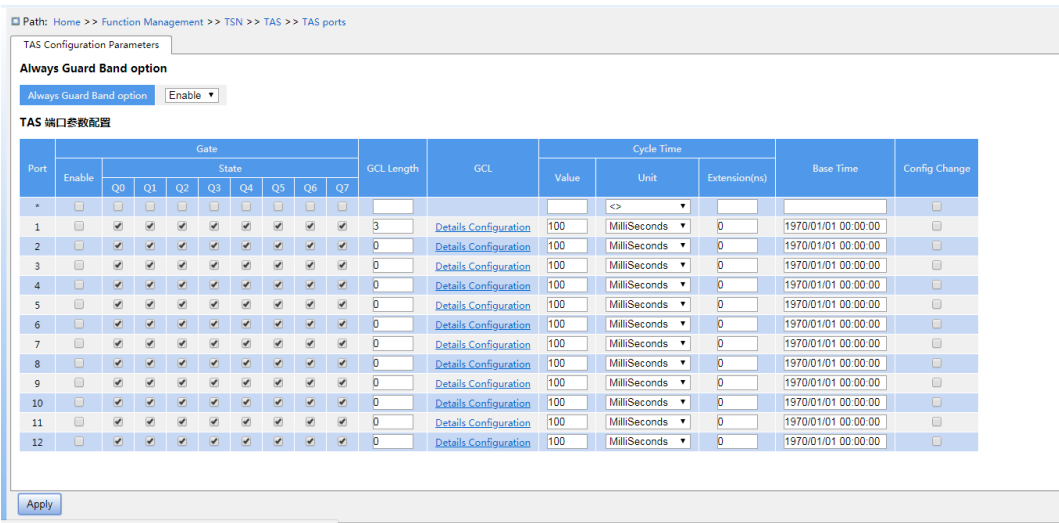

Figure 227 Qbv configuration

2、GCL configuration

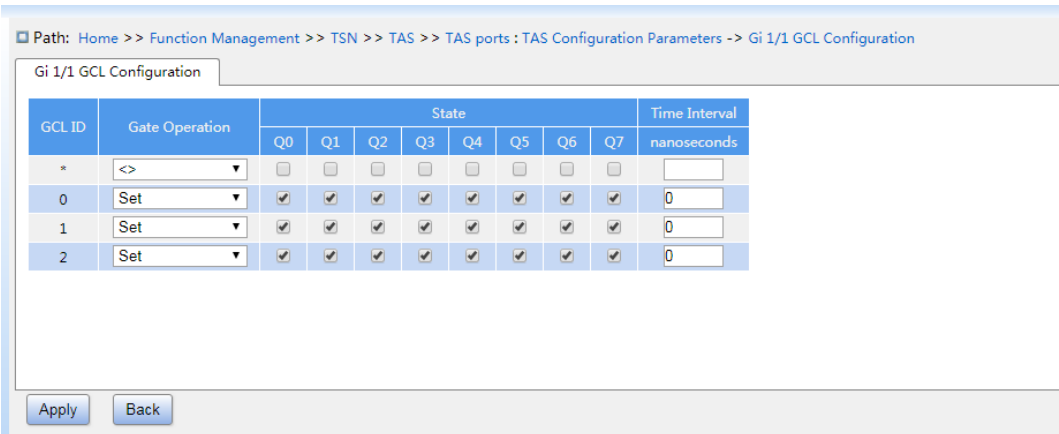

Figure 228 GCL configuration

Gate operation:

Set: Set the gate state indication value immediately;

SetAndHold: Stop transmission preemptive frame;

SetAndRelease: Allows frame preemption.

4、Qci configuration

Figure 229 Qci configuration

GCL length: Maximum GCL is 4 for each stream

7.15.4 Typical configuration example

1、 Create a stream with a source mac of 00-01- c1-00-00-00,vlan of 1.

stream 10

dmac any

smac 00-01-c1-00-00-00 / ff-ff-ff-00-00-00

outer-tag vid 1

2、 Create stream gate, cycle time is 100ms, base time is 2020/02/15 12:00:00, each cycle gate closes 99ms, opens 1ms, if receives the message at the gate closing time, the flow permanently blocks.

tsn stream gate 20

cycle-time 100 ms

close-due-to-invalid-rx-enable

base-time 2020/02/15 12:00:00

control-list index 0 gate-state closed time-interval 99 ms

control-list index 1 gate-state open time-interval 1 ms ipv 6

enable

3、 Enable configuration

tsn stream gate 20

state open

config-change

4、 The stream filter is created to match the gate operation that the stream ID10 message use ID of 20, and the stream is permanently blocked when more than 512 bytes of messages are received.

```
tsn stream filter 1
stream-id 10
priority 4
gate id 20
max-sdu 512
block-due-to-oversize-enable
end
```

7.16 NETCONF configuration

7.16.1 Presentation

With the increase of network scale and complexity, the simple management mode of traditional simple network management protocol SNMP can't adapt to the management of current complex network, especially cannot meet the requirements of configuration management. In order to make up for the defects of the SNMP, netconf protocol came into being.

7.16.2 Principle

NETCONF(Network Configuration Protocol) is the network management protocol based on XML and uses a simple mechanism based on RPC (Remote Procedure Call) to realize communication between client and server. It provides a programmable method to configure and manage network devices. Users can set parameters, obtain parameter values, obtain statistical information and so on through the protocol.

NETCONF message uses XML format, has powerful filtering ability, and each data item has a fixed element name and location, which makes different devices of the same manufacturer have the same access mode and result presentation mode. Devices between different vendors can also be mapped XML get the same effect, which makes it very convenient to develop third-party software. It is easy to develop special customized network management software in the environment of mixing different manufacturers and devices. And with the help of the network management software, the use of NETCONF functions will make the configuration management of network device simpler and more efficient

7.16.3 Web page configuration

1、 Enable NETCONF, as shown in below figure;

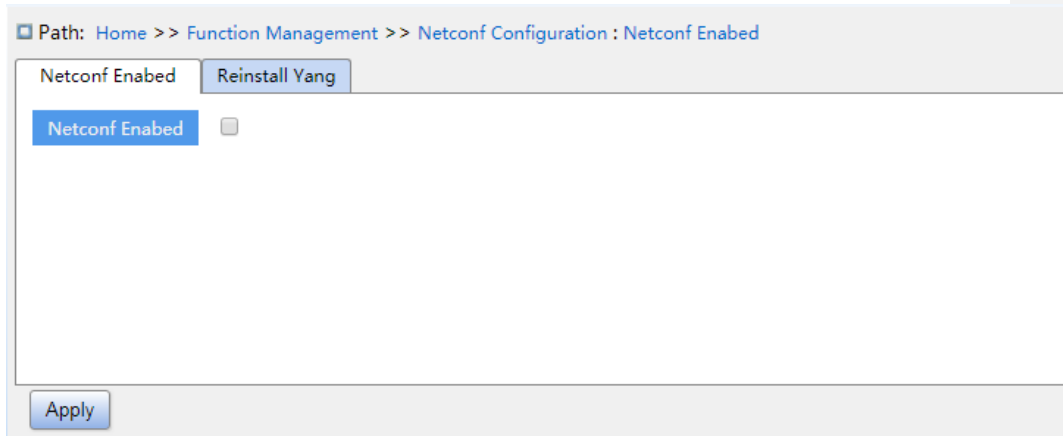

Figure 230 NETCONF function

2、 Reload yang file

When yang file on the device is modified, the yang file need to be reloaded, this function needs to enable in NETCONF to use, as shown in below;

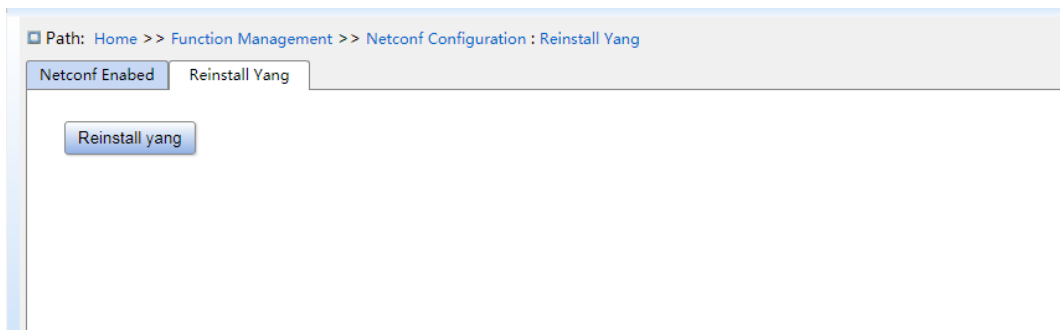

Figure 231 Reinstall yuan files

8 Diagnosis

8.1 Log

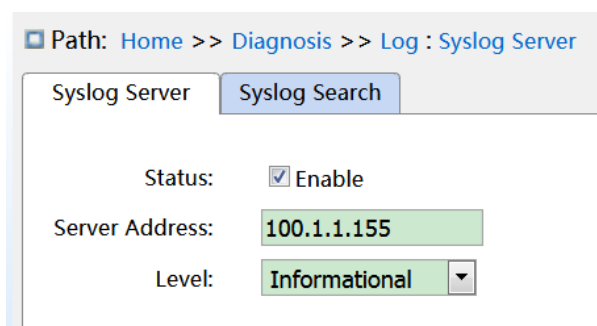

8.1.1 Introduction

The log function mainly records system status, fault, debugging, anomaly, and other information. With appropriate configuration, the switch can upload logs into a Syslog-supported server in real time.

Log contains information about alarms, broadcast storm, reboot, memory, and information about users' operations.

8.1.2 Web Configuration

1. Configure system log, as shown below.

Path: Home >> Diagnosis >> Log : Syslog Server

Syslog Server Syslog Search

Status: Enable

Server Address: 100.1.1.155

Level: Informational ▼

Figure 232 Configure Syslog Server

Status

Configuration options: Enable/disable

Default configuration: Disable

Function: whether enable syslog server.

Server address

Configuration format: A.B.C.D

Function: configure IP address of syslog server.

Level

Configuration options: Error/Warning/Notice/Information

Default configuration: Information

Function: Select displayed log information level.

2. Syslog search, as shown below.

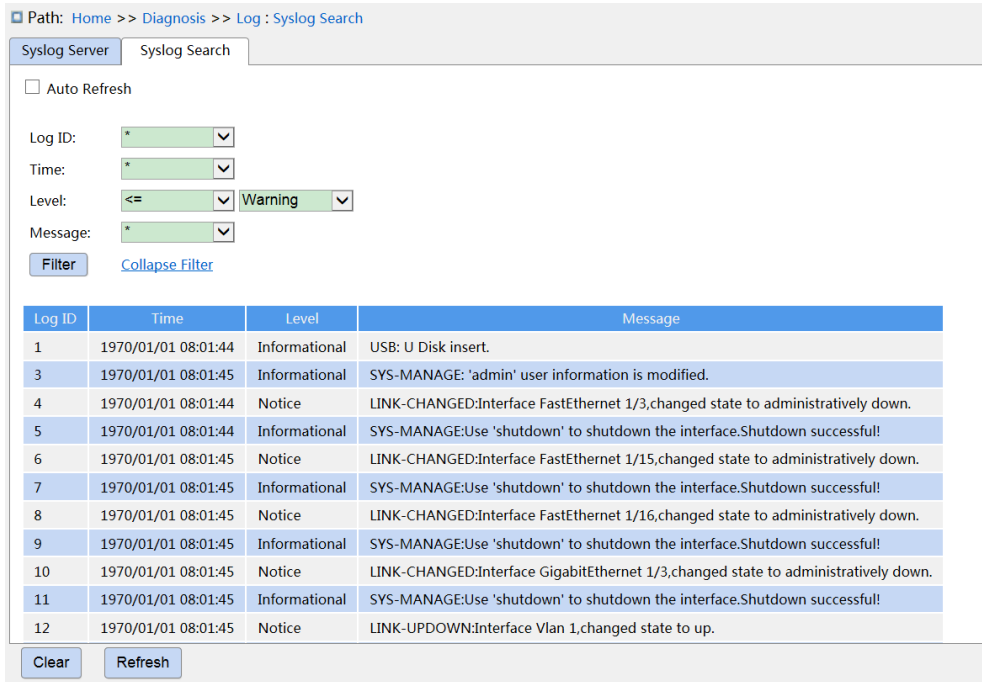

Figure 233 Syslog search

Auto Refresh

Configuration options: check/uncheck

Default configuration: uncheck

Function: whether enable auto refresh.

Log ID

Configuration options: */>=<=/select range

Default configuration: *

Function: Select filtered Log ID, “*” is all ID log, “>=” is Filter logs greater than or equal to an ID, “<=” is filter less than or equal to an ID, “select range” enter an ID range logs manually.

Time

Configuration options: */Start/end/select range

Default configuration: *

Function: Select filtered time range, “*” is all time log, “Start” is the start time of log, “end” is the end time of log, “select range” enter a time range logs manually.

Level

Configuration options: */>=<=/select range

Default configuration: *

Function: Select filtered level range, “*” is all level log, “>=” is filter logs greater than or equal to a level, “<=” is filter logs less than or equal to a level, “select range” enter a level range logs manually, the levels includes Error, Warning, Notice, Information.

Message

Configuration options: */include/not include

Default configuration: *

Function: Select filtered message, “*” is all logs, “include” include Logs for some fields, “not include” do not include logs for some fields.

3. Clear logs, as shown below.

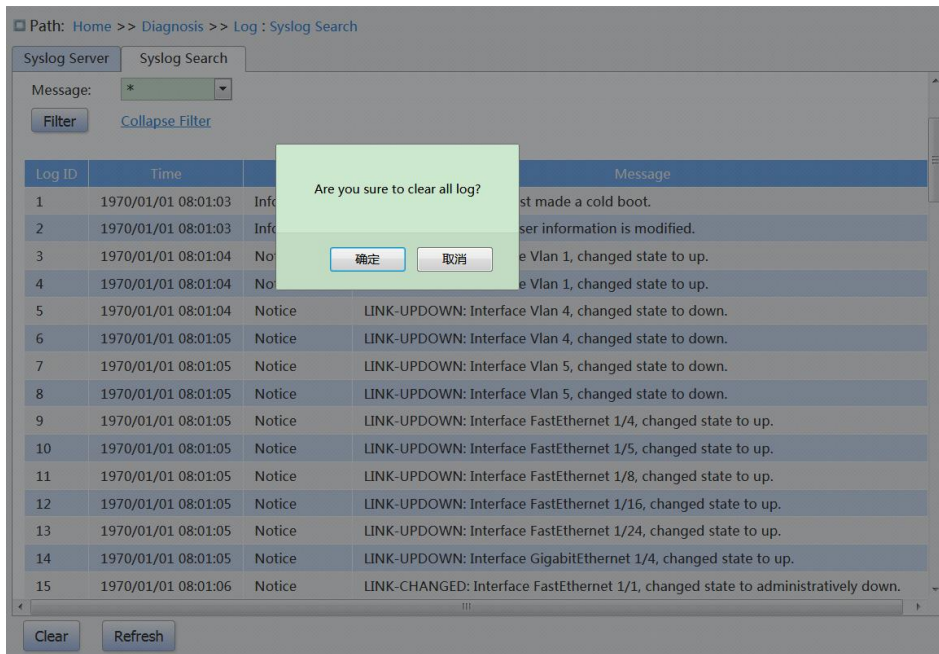

Figure 234 Clear logs

After the query log is finished, click lower left quarter <clear>button, clear logs.

The server of the syslog protocol can choose to install the software supporting syslog server on the PC, such as Tftpd32. The log information can be viewed in real time through syslog server, as shown below.

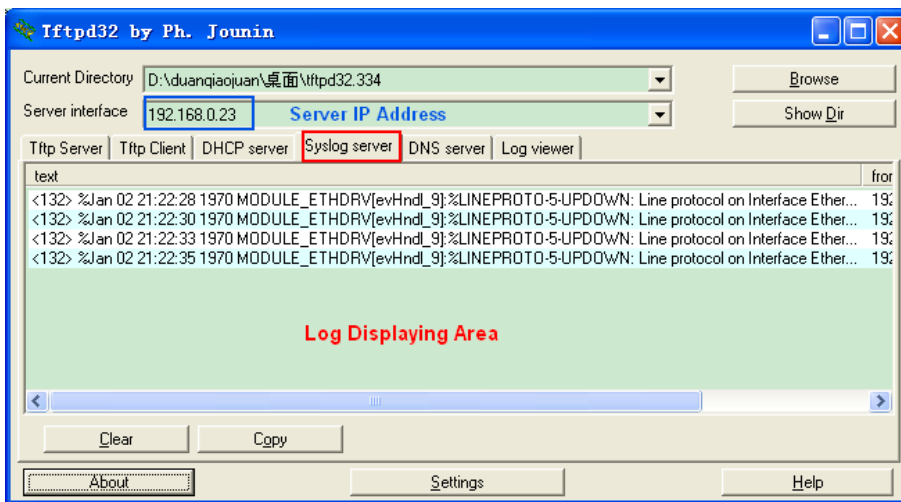

Figure 235 Real-time upload log information

8.2 Port Mirror

8.2.1 Introduction

With port mirror function, the switch copies all received or transmitted data frames in a port (mirror source port) to another port (mirror destination port). The mirrordestination port is connected to a protocol analyzer or RMON monitor for network monitor, management, and fault diagnosis.

8.2.2 Explanation

A switch supports only one mirror destination port but multiple source ports.

Multiple source ports can be either in the same VLAN, or in different VLANs. Mirrorsource port and destination port can be in the same VLAN or in different VLANs.

The source port and destination port cannot be the same port.

Caution:

The dynamic MAC address learning must be disabled on a destination port.

8.2.3 Web Configuration

1. Cofigure port mirror function, as shown below.

Figure 236 Cofigure Port Mirror Function

ALL

Configuration options: Check/uncheck

Default configuration: Uncheck

Function: Check this mirrored group to edit and modify.

Status

Configuration options: Enable/disable

Function: whether enable port mirror.

Destination Port

Configuration options: NULL/port number

Default configuration: NULL

Function: Select the mirror destination port , only one mirror destination port .

Rx

Configuration options: Enable/disable

Default configuration: Disable

Function: Whether to mirror frames received from the source port.

Tx

Configuration options: Enable/disable

Default configuration: Disable

Function: Whether to mirror frames trasnmitted from the source port.

2. Configure Remote Mirror, as shown below.

Figure 237 Configure Remote Mirror

All

Configuration options: Check/uncheck

Default configuration: Uncheck

Function: Check this mirrored group to edit and modify.

Status

Configuration options: Enable/disable

Function: whether enable port mirror.

Destination Remote

Configuration options: Enable/disable

Default configuration: Disable

Function: Whether enable destination remote mirror, destination and source remote cannot be enabled at the same time.

Destination VLAN ID

Configuration range: 1~4093

Function: Configure VLAN ID of destination remote mirror.

Destination Port

Configuration options: NULL/Port number

Default configuration: NULL

Function: When configuring the destination remote mirror, the destination port is used as the reflection port, and when configuring the source remote mirror, the destination port is the remote mirror destination port.

Source Remote

Configuration options: Enable/disable

Default configuration: Disable

Function: Whether enable source remote mirror, destination and source remote cannot be enabled at the same time.

Source VLAN ID

Configuration range: 1~4093

Function: Configure VLAN ID of source remote mirror.

Source Port

Configuration options: Disable/RX/TX

Default configuration: Disable

Function: When configuring the destination remote mirror, configure the remote mirror source port if mirror the receiving or sending frame, and when the source remote image is configured, the source port cannot be configured.

8.2.4 Typical Configuration Example

As shown in Figure 238, the mirror destination port is port 2 and the mirror source port is port 1. Both transmitted and received packets on port 1 are mirrored to port 2.

Figure 238 Port Mirror Example

Configuration process:

1. Enable port mirror function, as shown in Figure 236.
2. Set port 2 to the mirror destination port, port 1 to the mirror source port and the port mirror mode to both, as shown in Figure 236.

8.3 LLDP

8.3.1 Introduction

The Link Layer Discovery Protocol (LLDP) provides a standard link layer discovery mechanism. It encapsulates device information such as the capability, management address, device identifier, and interface identifier in a Link Layer Discovery Protocol Data Unit (LLDPDU), and advertises the LLDPDU to its directly connected neighbors. Upon receiving the LLDPDU, the neighbors save these information to MIB for query and link status check by the NMS.

8.3.2 Web Configuration

1. Configure LLDP, as shown below.

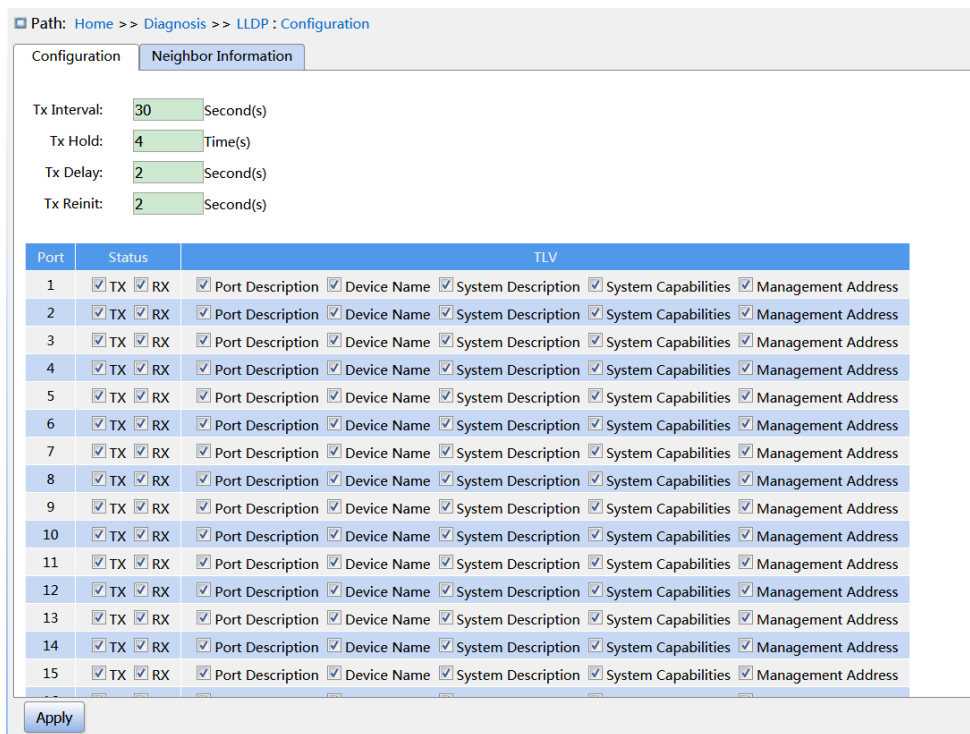

Figure 239 Configure LLDP

Tx Interval

Configuration range: 5~32768s

Default configuration: 30s

Function: Configutr the time interval for sending LLDP packets.

Tx Hold

Configuration range: 2~10 times

Default configuration: 4 times

Function: Set the number of Tx holding times. Effective duration of an LLDP packet = Tx Interval x Tx Hold.

Tx Delay

Configuration range: 1~8192s

Default configuration: 2s

Function: Set the transmission interval between a new LLDP packet and the previous LLDP packet after configuration information is changed. The value of Tx Delay cannot be larger than 1/4 of the value of Tx Interval.

Tx Reinit

Configuration range: 1~10s

Default configuration: 2s

Function: After LLDP is disabled on a port or a switch is restarted, the switch sends an LLDP shutdown frame to a neighboring node to announce that the previous LLDP packet is invalid.

Tx Reinit refers to the interval between transmission of the LLDP shutdown frame and re-initialization of an LLDP packet.

Status

Configuration options:Disable/TX/RX/TX&RX

Default configuration: TX&RX

Function: Configure the LLDP packet mode. Enabling TX&RX mode means that the switch sends both LLDP packets and also receives and identifies LLDP packets; Disable mode means that the switch neither sends LLDP packets nor receives LLDP packets; Only the Rx mode means that the switch only receives and recognizes LLDP packets and does not send LLDP packets; Only the Tx mode means that the switch only sends LLDP packets and does not receive LLDP packets.

Port Description

Configuration options: Enabled/Disabled

Default configuration: Enabled

Function: Enable indicates LLDP packets will carry port description.

Device Name

Configuration options: Enabled/Disabled

Default configuration: Enabled

Function: Enable indicates LLDP packets will carry system name.

System Description

Configuration options: Enabled/Disabled

Default configuration: Enabled

Function: Enable indicates LLDP packets will carry system description.

Sys Capability

Configuration options: Enabled/Disabled

Default configuration: Enabled

Function: Enable indicates LLDP packets will carry system capability.

Management Address

Configuration options: Enabled/Disabled

Default configuration: Enabled

Function: Enable indicates LLDP packets will carry management address.

2. View LLDP information, as shown below.

Path: Home >> Diagnosis >> LLDP: Neighbor Information

Local Port	Neighbor						
	Chassis ID	Port	Port Description	Device Name	System Description	System Capabilities	Management Address
FastEthernet 1/4	00-01-C1-00-00-01	Port_8	FastEthernet 1/8	A8012-220	R0003 Jan 3 2017 09:27:10	Bridge(+)	100.1.1.220

Figure 240 View LLDP Information

Caution:

To display LLDP information, LLDP must be enabled on the two connected devices.

8.4 Trace Route

Trace route allows us to see the route of IP data packets from one host to another.

1. Configure Trace route, as shown below.

Figure 241 Configure Traceroute

Destination address

Configuration format: A.B.C.D

Function: Configure IP address of destination device.

Timeout Period

Configuration range: 1~10s

Default configuration: 2s

Function: Configure timeout period, If the sending end does not receive a response message from the receiving end within this time, the communication failed.

Max Hop

Default Configuration range: 1~255

Default configuration: 30

Function: Test the number of gateways that data packets pass from the sending device to the destination device.

2. View Traceroute command output information, as shown below.

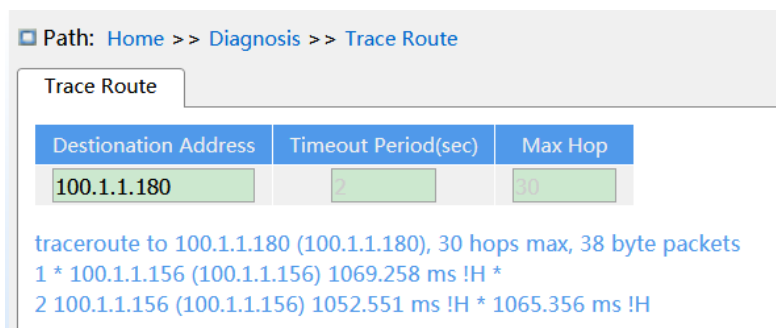

Figure 242 View output

8.5 Ping

Users can run the ping command to check whether the device of a specified address is reachable and whether the network connection is faulty during routine system maintenance.

1. Configure ping command, as shown below.

Figure 243 Configure Ping Command

Server Address

Format: A.B.C.D

Description: Input the IP address of the destinate device.

Ping Length

Configuration range: 2~1452 bytes

Default configuration: 56 bytes

Function: Specify the length of an ICMP request (excluding the IP and ICMP packet header) for transmission.

Ping Count

Configuration range: 1~60

Default configuration: 5

Function: Specify the number of times for sending an ICMP request.

Ping Interval

Configuration range: 0~30s

Default configuration: 0s

Function: Specify the interval for sending an ICMP request.

2. View ping output, as shown below.

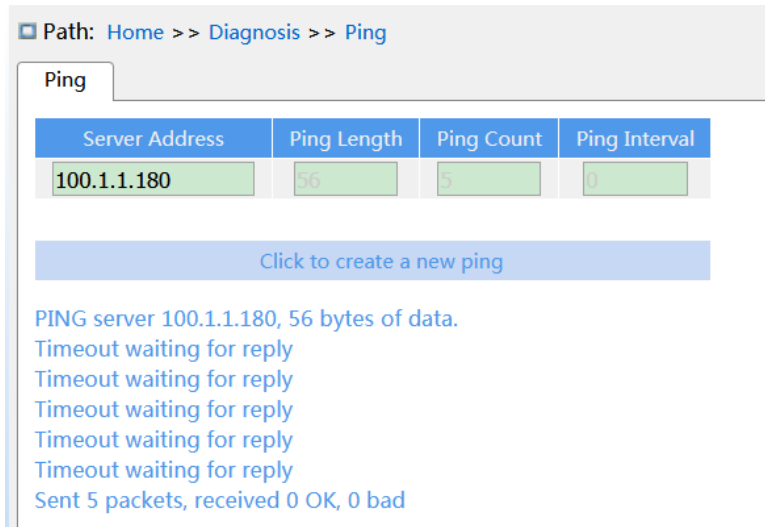

Figure 244 Viewe Ping Output

The output of the ping command includes response of the destination device to each ICMP request packet and packet statistics collected during the running of the ping command.

8.6 IP Source Guard

8.6.1 Introduce

Through the binding function of IP Source Guard, the messages forwarded by the port can be filtered to prevent the illegal messages pass through the port, thus it limits the illegal use of network resource (such as illegal host counterfeit legitimate user IP access the network), improving the security of the port.

Figure 245 IP Source Guard function diagram

8.6.2 Principle

The configured port with this feature search IP Source Guard binding table after receiving the message, If the feature item in the message matches the recorded feature item in the binding table, the port forwards the message, otherwise, drop the message. Binding function is for the port, one port is binding, only this port is restricted, the other ports are not affected by the binding.

The feature item of IP Source Guard includes: source IP address, source MAC address, and VLAN tag. And it supports the combination of ports with the following features item (binding table item in short):

- IP、MAC、IP+MAC
- IP+VLAN、MAC+VLAN、IP+MAC+VLAN

The supported type of binding table items by the port is related to the type of the device, depending on the actual situation of the device.

IP Source Guard is divided into static binding and dynamic binding according to the generation mode of binding table items:

- **Static binding:** By manually configuring binding table items to control the port, it is suitable for the case that the number of hosts in the local network is less or a host need to bind separately.
- **Dynamic binding:** The port control function is accomplished by automatically obtaining the binding table items of DHCP Snooping or DHCP Relay, which is suitable for many hosts in local area network and using DHCP to configure dynamic hosts, it can effectively prevent IP address conflicts and embezzlement. The principle is that whenever DHCP assigns a table item to a user, the dynamic binding function adds a binding table item accordingly to allow the user to access the network. If a user sets the IP address privately, the user will not be able to access the network because it does not trigger the DHCP assignment table item, and the dynamic binding function does not add the corresponding access permission rule.

8.6.3 Web Configuration

1. Enable IP Source Guard, as shown below.

Figure 246 Configure IP Source Guard

Mode

Configuration options: Enable/disable

Default configuration: Disabel

Function: Whether enable global IP Source Guard.

2. Configure Port IP Source Guard, as shown below.

Figure 247 Configure Port IP Source Guard

Enable

Configuration options: Enable/disable

Default configuration: Disable

Function: Whether enable port IP Source Guard.

3. Static Binding Configuration, as shown below.

Figure 248 Static Binding Configuration

VLAN ID

Configuration options: All VLAN ID

Function: configure VLAN ID of static binding table.

Port

Function: Select member port of the static binding table.

IP address

Configuration format: A.B.C.D

Function: configure IP address of static binding table.

MAC address

Configuration format: HH-HH-HH-HH-HH-HH 或 HH:HH:HH:HH:HH:HH (H is a hexadecimal number)

Function: Configure MAC address of static binding table, only configure as unicast MAC address.

4. View Dynamic Binding table, as shown below.

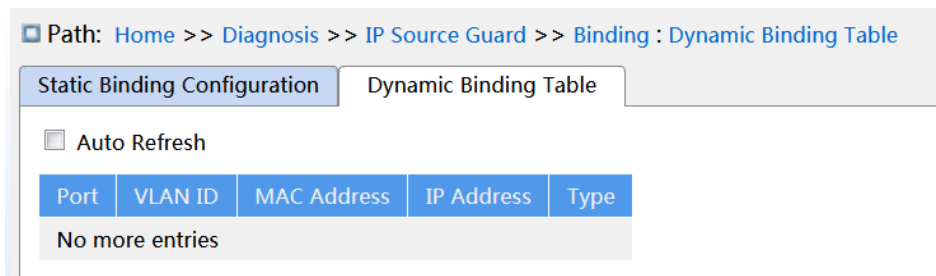

Figure 249 View Dynamic Binding table

Type

Display options: Relay/Snooping

Description: The dynamic binding table is generated by DHCP Relay and DHCP Snooping

devices, the table items of Relay type is generated after enable global IP Source Guard, table items of type snooping are generated after both the global and ports that connect to the DHCP client enable IP Source Guard.

8.6.4 Typical Configuration Example

1. Relay type IP Source Guard table items

As shown in Figure 250, Switch A as the DHCP server, switch B as the DHCP relay, switch C as the DHCP client, and 1 port of switch A connected to the 1 port of switch B, 2 port of switch B connect to 2 port of switch C. DHCP server is not in the same LAN as the DHCP client. After the relay device enable IP Source Guard, the client dynamically obtains the IP address and other network parameters with DHCP mode through DHCP relay. The relay device forms IP Source Guard table items.

Figure 250 DHCP typical configuration example

➤ Switch A configuration:

1. Create VLAN1 and configure IP address: 100.1.1.156;
2. Open the DHCP server state in VLAN 1, as shown in Figure 170;
3. Create address pool pool-33, as shown in Figure 171;
4. Select address pool type as Network; IP address: 33.1.1.6; Mark: 255.0.0.0, as shown in Figure 172;

➤ Switch B configuration:

1. Create VLAN1 and configure IP address: 100.1.1.180;
2. Create VLAN33 and configure IP address: 33.1.1.2;
3. Enable DHCP relay, as shown in Figure 185;
4. Configure Server IP address: 100.1.1.156, as shown in Figure 185;
5. Enable global IP Source Guard, as shown in Figure 246;

➤ Switch C configuration:

1. Create VLAN33 and enable DHCP Client;
2. Switch A assigns address 33.0.0.1 to Switch C;

After the switch C gets the address, the IP Source Guard table can be viewed on the switch B, as shown in Figure 249.

2. Snooping type IP Source Guard table items

As shown below, Switch A as the DHCP server, switch B as the DHCP Snooping, switch C as the DHCP client, and 1 port of switch A connected to the 1 port of switch B, 2 port of switch B connect to 2 port of switch C. DHCP server is not in the same LAN as the DHCP client. After Snooping device enable IP Source Guard, the client dynamically obtains the IP address and other network parameters with DHCP mode through DHCP Snooping. The relay device forms IP Source Guard table items.

Figure 251 DHCP typical configuration example

➤ Switch A configuration:

1. Create VLAN1 and configure IP address: 100.1.1.156;
2. Open the DHCP server state in VLAN 1, as shown in Figure 170;
3. Create address pool pool-1;
4. Select address pool type as Network; IP address: 33.1.1.6; Mark: 255.0.0.0;

➤ Switch B configuration:

1. Create VLAN1 and configure IP address: 100.1.1.180;
2. Enable DHCP Snooping;
3. Configure 1 port as trust port, as shown in Figure 181;
4. Enable global IP Source Guard, as shown in Figure 246;
5. Port 2 enable IP Source Guard, as shown in Figure 247;

➤ Switch C configuration:

1. Create VLAN1 and enable DHCP Client;

2. Switch A assigns address 100.0.0.1 to Switch C;

After the switch C gets the address, the IP Source Guard table can be viewed on the switch B.
